All contents of this document are subject to change without notice and do not represent a commitment on the part of Dialogic Corporation or its subsidiaries. Reasonable effort is made to ensure the accuracy of the information contained in the document. However, due to ongoing product improvements and revisions, Dialogic Corporation and its subsidiaries do not warrant the accuracy of this information and cannot accept responsibility for errors or omissions that may be contained in this document.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH DIALOGIC® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS EXPLICITLY SET FORTH BELOW OR AS PROVIDED IN A SIGNED AGREEMENT BETWEEN YOU AND DIALOGIC, DIALOGIC ASSUMES NO LIABILITY WHATSOEVER, AND DIALOGIC DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF DIALOGIC PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHT OF A THIRD PARTY.

Dialogic products are not intended for use in medical, life saving, life sustaining, critical control or safety systems, or in nuclear facility applications.

It is possible that the use or implementation of any one of the concepts, applications, or ideas described in this document, in marketing collateral produced by or on web pages maintained by Dialogic Corporation or its subsidiaries may infringe one or more patents or other intellectual property rights owned by third parties. Dialogic Corporation or its subsidiaries do not provide any intellectual property licenses with the sale of Dialogic products other than a license to use such product in accordance with intellectual property owned or validly licensed by Dialogic Corporation or its subsidiaries. More detailed information about such intellectual property is available from Dialogic Corporation's legal department at 9800 Cavendish Blvd., 5th Floor, Montreal, Quebec, Canada H4M 2V9. The software referred to in this document is provided under a Software License Agreement. Refer to the Software License Agreement for complete details governing the use of the software.

Dialogic Corporation encourages all users of its products to procure all necessary intellectual property licenses required to implement any concepts or applications and does not condone or encourage any intellectual property infringement and disclaims any responsibility related thereto. These intellectual property licenses may differ from country to country and it is the responsibility of those who develop the concepts or applications to be aware of and comply with different national license requirements.

Dialogic, Dialogic Pro, Brooktrout, Cantata, SnowShore, Eicon, Eicon Networks, Eiconcard, Diva, SIPcontrol, Diva ISDN, TruFax, Realblobs, Realcomm 100, NetAccess, Instant ISDN, TRXStream, Exnet, Exnet Connect, EXS, ExchangePlus VSE, Switchkit, N20, Powering The Service-Ready

Network, Vantage, Connecting People to Information, Connecting to Growth, Making Innovation Thrive, and Shiva, among others as well as related logos, are either registered trademarks or trademarks of Dialogic.

Windows NT is a registered trademarks of Microsoft Corporation in the United States and/or other countries. Other names of actual companies and products mentioned herein are the trademarks of their respective owners.

This document discusses one or more open source products, systems and/or releases. Dialogic is not responsible for your decision to use open source in connection with Dialogic products (including without limitation those referred to herein), nor is Dialogic responsible for any present or future effects such usage might have, including without limitation effects on your products, your business, or your intellectual property rights.

Dialogic Product Line Warranty

Unless otherwise stated in an applicable product purchase agreement between the Customer and Dialogic, Dialogic warrants that during the Warranty Period, products will operate in substantial conformance with Dialogic's standard published documentation accompanying the product. If a product does not operate in accordance therewith during the Warranty Period, the Customer must promptly notify Dialogic. Dialogic, at its option, will either repair or replace the product without charge. The Customer has the right, as their exclusive remedy, to return the product for a refund of purchase price or license fee if Dialogic is unable to repair or replace it.

Warranty Period

In the event that you have no signed agreement setting out a warranty period, the Warranty Period shall be the standard warranty period set out on www.dialogic.com on the date of your purchase of the product.

The Warranty Period begins on the date of shipment of any products or software by Dialogic.

The Warranty Period for repaired, replaced or corrected products and software shall be coterminous to the Warranty Provided for the original products or software purchased.

To report warranty claims, Customer may contact Dialogic via email at techsupport@cantata.com or call (781) 433-9600.

Warranty Provisions

A. During the Warranty Period, Dialogic warrants to Customer only that:

- (i) Products manufactured by Dialogic (including those manufactured for Dialogic by an original equipment manufacturer) will be free from defects in material and workmanship and will substantially conform to specifications for such products;
- (ii) software developed by Dialogic will be free from defects which materially affect performance in accordance with the specifications for such software. With respect to products or software or partial assembly of products furnished by Dialogic but not manufactured by Dialogic, Dialogic hereby assigns to Customer, to the extent permitted, the warranties given to Dialogic by its vendors of such items.

B. If, under normal and proper use, a defect or non conformity appears in warranted products or software during the applicable Warranty Period and Customer promptly notifies Dialogic in writing during the applicable warranty period of such defect or non conformance, and follows Dialogic's instructions regarding return of such defective or non conforming Product or Software, then Dialogic will, at no charge to Customer, either:

- (i) repair, replace or correct the same at its manufacturing or repair facility or
- (ii) if Dialogic determines that it is unable or impractical to repair, replace or correct the product or software, provide a refund or credit not to exceed the original purchase price or license fee.

C. No product or software will be accepted for repair or replacement without the written authorization of and in accordance with instructions from Dialogic. Removal and reinstallation expenses as well as transportation expenses associated with returning such product or software to Dialogic shall be borne by Customer. Dialogic shall pay the costs of transportation of the repaired or replaced product or software to the destination designated in the original Order. If Dialogic determines that any returned product or software is not defective, Customer shall pay Dialogic's costs of handling, inspecting, testing and transportation. In repairing or replacing any product, part of product, or software medium under this warranty, Dialogic may use new, remanufactured, reconditioned, refurbished or functionally equivalent products, parts or software media. Replaced products or parts shall become Dialogic's property.

D. Dialogic makes no warranty with respect to defective conditions or non conformities resulting from any of the following: Customer's modifications, misuse, neglect, accident or abuse; improper wiring, repairing, splicing, alteration, installation, storage or maintenance performed in a manner not in accordance with Dialogic's or its vendor's specifications, or operating instructions; failure of Customer to apply Dialogic's previously applicable modifications or corrections; or items not manufactured by Dialogic or purchased by Dialogic pursuant to its procurement specifications. Dialogic makes no warranty with respect to products which have had their serial numbers removed or altered; with respect to expendable items, including, without limitation, fuses, light bulbs, motor brushes and the like; or with respect to defects related to Customer's data base errors. Improper packaging of product for repair will not be covered under this warranty agreement. No warranty is made that software will run uninterrupted or error free.

E. Warranty does not include:

- a) Dialogic's assistance in diagnostic efforts;
- b) access to Dialogic's Technical Support web sites, databases or tools;
- c) product integration testing;
- d) on-site assistance; or
- e) product documentation updates.

These services are available either during or after warranty at Dialogic's published prices.

F. THE FOREGOING WARRANTIES ARE EXCLUSIVE & ARE GRANTED IN LIEU OF ALL OTHER EXPRESS & IMPLIED WARRANTIES (WHETHER WRITTEN, ORAL, STATUTORY OR OTHERWISE), INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. CUSTOMER'S SOLE AND EXCLUSIVE REMEDY AND DIALOGIC'S SOLE OBLIGATION HEREUNDER, SHALL BE TO REPAIR, REPLACE, CREDIT OR REFUND AS SET FORTH ABOVE.

G. IN NO EVENT SHALL DIALOGIC, ITS DIRECTORS, OFFICERS, EMPLOYEES, AGENTS OR AFFILIATES, BE LIABLE FOR ANY COSTS OR DAMAGES ARISING DIRECTLY OR INDIRECTLY FROM YOUR USE OF ANY PRODUCT INCLUDING ANY INDIRECT,

INCIDENTAL, SPECIAL, EXEMPLARY, MULTIPLE, PUNITIVE OR CONSEQUENTIAL DAMAGES, INCLUDING LOST PROFITS, WHETHER BASED ON CONTRACT, TORT (INCLUDING NEGLIGENCE), STRICT LIABILITY OR OTHER LEGAL THEORY, EVEN IF DIALOGIC, OR ANY OF ITS DIRECTORS, OFFICERS, EMPLOYEES, AGENTS OR AFFILIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY EVENT, DIALOGIC'S CUMULATIVE LIABILITY TO YOU FOR ANY AND ALL CLAIMS RELATING TO THE USE OF ANY PRODUCT SHALL NOT EXCEED THE TOTAL AMOUNT OF THE PURCHASE PRICE OR LICENSE FEES PAID TO DIALOGIC FOR SUCH PRODUCT.

H. CUSTOMER AND DIALOGIC HEREBY WAIVE THEIR RIGHT TO TRIAL BY JURY TO THE FULLEST EXTENT PERMITTED BY LAW IN CONNECTION WITH ALL CLAIMS ARISING OUT OF OR RELATED TO THIS WARRANTY, THE PRODUCTS COVERED HEREBY OR THE PERFORMANCE OF ANY PARTY HEREUNDER.

I. THIS WARRANTY SHALL BE CONSTRUED UNDER AND GOVERNED BY THE LAWS OF THE COMMONWEALTH OF MASSACHUSETTS WITHOUT GIVING EFFECT TO ANY CHOICE OR CONFLICT OF LAW PROVISION OR RULE (WHETHER OF THE COMMONWEALTH OF MASSACHUSETTS OR ANY OTHER JURISDICTION) THAT WOULD CAUSE THE APPLICATION OF THE LAWS OF ANY JURISDICTION OTHER THAN THE COMMONWEALTH OF MASSACHUSETTS. CUSTOMER SPECIFICALLY AND IRREVOCABLY CONSENTS TO THE PERSONAL AND SUBJECT MATTER JURISDICTION AND VENUE OF THE FEDERAL AND STATE COURTS OF THE COMMONWEALTH OF MASSACHUSETTS AND SUCH COURTS SHALL HAVE EXCLUSIVE JURISDICTION WITH RESPECT TO ALL MATTERS CONCERNING THIS WARRANTY OR THE ENFORCEMENT OF ANY OF THE FOREGOING.

J. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS. YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM JURISDICTION TO JURISDICTION.

About this Publication

Purpose

This publication provides guidelines for using the Dialogic® CSP.

Safety Labels

The following Safety labels may appear in this information product to alert customers to avoidable hazards. The following are in the order of priority:

DANGER

Danger indicates the presence of a hazard that will cause death or severe personal injury if the hazard is not avoided.

WARNING

Warning indicates the presence of a hazard that can cause death or severe personal injury if the hazard is not avoided.

CAUTION

Caution indicates the presence of a hazard that will or can cause minor personal injury or property damage if the hazard is not avoided. Caution can also indicate the possibility of data loss, loss of service, or that an application will fail.

Conventions used

This information product uses the text conventions explained below. In addition, hexadecimal numbers are preceded by a zero and small “x.” For example, the decimal number 15 is represented in hexadecimal as 0x0F.

Convention	Description
...	A horizontal ellipsis in an API message indicates fields of variable length.
:	A vertical ellipsis in an API message indicates that a block of information is repeated or is variable.
<i>n</i>	The letter <i>n</i> is a generic placeholder for a number.
Sans serif mono space	Indicates a command name, option, input, output, non-GUI error, and system messages.
<i>Sans serif monospace italic</i>	Indicates a parameter name in an input message. Example: move *.dot a: c: -s The -s is the parameter.
<i>Serif italic</i>	Indicates the name of a book, chapter, path, file, or API message. Example: <i>UserDirectory/Config.exe</i>
Boldface	Indicates keyboard keys, key combinations, and command buttons Example: Ctrl+Alt+Del
Sans serif boldface	Identifies text that is part of a graphical user interface (GUI). Example: Go to the Configuration menu and select Card->Span Configuration

1 EXS & SwitchKit API Messages

Overview

Purpose This chapter provides an introduction to API messages and then lists the EXS Application Programming Interface (APIs) messages created by Dialogic. The messages are listed alphabetically. Within the messages are hyperlinks to messages modules (AIBs, ICBs, and TLVs) that are carried by the messages.

Introduction to API Messages

Overview **Messages and Responses**

Messages and Responses each contain a header and a checksum, and can also contain AIBs (Address Information Blocks), ICBs (Information Control Blocks), TLVs (Tag-Length-Value blocks), and data.

Data

Data can reside in its own Data field or within AIBs, ICBs, or TLVs.

Field

A Field corresponds to a single row in the main Message/Response table, and it can be either one byte (for example 0x1B) or two bytes long (for example 0x1B4D). In accordance with Big Endian formatting, when a field is two bytes long, the first byte (in this case 0x1B) is the Most Significant Byte (MSB) and the second byte (in this case 0x4D) is the Least Significant Byte (LSB).

The next figure, *EXS API Message / Response Table*, provides an overview of API messages and refers to the chapters containing the specific information.

Figure 1-1 EXS API Message / Response Table

Messages and Responses each contain a header, checksum, and AIB (Address Information Block). Messages and Responses can also contain ICBs (Information Control Blocks), TLVs, (Tag-Length-Value blocks) and data. Data can reside in its own Data field or within ICBs or TLVs. A Field corresponds to a single row in the main Message/Response table, and it can be either one byte (for example 0x1B) or two bytes long (for example 0x1B4D). In accordance with Big Endian formatting, when a field is two bytes long, the first byte (in this case 0x1B) is the Most Significant Byte (MSB) and the second byte (in this case 0x4D) is the Least Significant Byte (LSB).

A **Message** is sent from the host computer to the EXS CSP, or vice versa.

A **Response** is sent from the EXS CSP in reply to a Message from the host computer, or vice versa. If the Response comes from the EXS CSP, the AIBs, ICBs, TLVs, and Data field values might match those that were sent in the corresponding Message.

Message (white)	Response (gray)
Header	Header
<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p style="text-align: center;">AIB</p> <p>An AIB contains one or more AEs. AIBs are listed in the API message and are fully defined in the AIBs chapter.</p> <div style="border: 1px solid black; width: 80px; margin: 5px auto; text-align: center;">AE</div> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">AE (possible)</div> </div> <div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p style="text-align: center;">ICB</p> <p>There are three types of ICB: Action (0x01) Data (0x02) and Extended Data (0x03). An ICB can contain TLVs, and ISDN ICBs can contain IEs. ICBs are listed in the API messages and are fully defined in the ICBs chapter.</p> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">TLV (possible)</div> </div> <div style="border: 1px solid black; padding: 5px;"> <p style="text-align: center;">TLV</p> <p>A TLV can stand on its own in a message or it can be embedded in an ICB. A TLV can also contain one or more levels of nested TLVs. In this case, the TLV Count applies to only the "outermost" (highest level) TLVs, and not to the nested TLVs.</p> <p>TLVs are listed in the API messages and are fully defined in the TLVs chapter.</p> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">Nested TLV (possible)</div> </div>	<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p style="text-align: center;">AIB</p> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">AE</div> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">AE (possible)</div> </div> <div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p style="text-align: center;">ICB</p> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">TLV (possible)</div> </div> <div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p style="text-align: center;">TLV</p> <div style="border: 1px solid black; width: 100px; margin: 5px auto; text-align: center;">Nested TLV (possible)</div> </div> <div style="border: 1px solid black; padding: 5px;"> <p style="text-align: center;">Status</p> <p>Unlike a Message, a Response can have a Status field, but only if the Response comes from the EXS CSP. A Response from the host computer has no Status field.</p> <p>A value that appears in the Status field is named a Response Status Value (RSV). If an RSV is used by more than one message, it is defined in the Common Response Status Values chapter. An RSV that is unique to a specific Response is defined on the Response side of the Message/Response table itself.</p> </div>
Checksum	Checksum

Generic API Message Format

API messages and responses are frames, containing strings of paired characters. The characters are represented in hexadecimal notation. Each frame consists of a standard header, followed by a variable number of data bytes. The data is unique to each message.

All messages, whether initiated by the CSP or by the host, must have a corresponding Response. The message fields are shown on the left (white) side of the table and the response fields are shown on the right (gray) side.

In this example, standard header information (bytes 0–) is indicated by the bold outline.

Field Descriptions

This section describes the fields in the header of each API message and response.

Frame

The first field in every message is always the *Frame* field. It is a one-byte value that indicates the beginning of the frame. The value **0xFE** is reserved for this purpose alone.

Because the value 0xFE is reserved for the *Frame* field, you must never use this value in any other field. If you must send the value 0xFE within the contents of a message, you must encode it using an escape sequence.

Length

The second field is always the *Length* field. It is a value that indicates the number of bytes to follow, excluding the *Checksum*.

Important! The system calculates the message length before using an escape sequence. You must do the same.

To calculate the value of the *Length* field, count the bytes between, but not including, the *Length* field and the *Checksum* field. In the message below, the length is 5. You can see the value 5 in the second byte of the length field, represented in hexadecimal notation as **0x05**.

MESSAGE	
Byte	Field Description
0	Frame Character (0xFE)
1	Length, MSB (0x00)
2	Length, LSB (0x05)
3	Message Type, MSB

MESSAGE	
Byte	Field Description
4	Message Type, LSB
5	Reserved (0x00)
6	Sequence Number
7	Node ID
8	Checksum

Message Type

The third field is always the *Message Type* field. It is a value that identifies the format and particular information contained in the message or response.

Sequence Number

Use the Sequence Number field(s), Bytes 5 and 6, to match corresponding responses and messages. Because the EXS API protocol is asynchronous, the system may contain more than one outstanding message of the same type. When a response to one of these messages returns, the response would be useless if there were no way to trace it to its corresponding message.

The Sequence Number resolves this issue by initiating either an 8-bit or 16-bit sequence number in an EXS API message. The sender of the message (either the host or the CSP) assigns the sequence number.

To provide backward compatibility, the 16-bit sequence number is enabled using the Generic Card Configure 0x0122 message and can be queried using the Generic Card Query 0x0123 message. The Matrix/Host Sequence Number Size TLV (0x0640) is used to configure either the 8-bit or 16-bit sequence number.

- 8-Bit Sequence Number

An 8-bit sequence number in the Byte 6 field is the default configuration. In this configuration, the Byte 5 field should always be set to 0x00 in CSP and Host initiated messages. Any other value in this field is reset to 0x00 in the response message to the Host. An 8-bit sequence number is in the range of 0x00-0xFF.

- 16-bit Sequence Number

A 16-bit sequence number extends the 8-bit sequence number Byte 6 (LSB) field into the Byte 5 (MSB) field to create a 16-bit sequence number. A 16-bit sequence number will be in the range of 0x00-0xFFFF.

When the CSP Matrix Series 3 Card is configured to use the 16-bit sequence number, Bytes 5 and 6 will contain the sequence number for both Host and CSP-initiated messages.

- A 16-bit sequence number in a Host-initiated message will follow the message through the CSP and be returned in the response.
- A 16-bit sequence number in a CSP-initiated message will be passed to the Host and be expected in the Host response.

Important! The 16-bit Sequence Number does not support LAPD and EXNET Connect® .

AIB

Address Information Blocks (AIBs) are used to address system objects such as slots, spans, and channels. An AIB can contain one or more Address Elements (AEs) to accommodate a variety of addressing requirements. An Address Element is a group of data bytes that represent specific address information.

Status

Most responses contain a *Status* field that follows the header. If the CSP processes a message successfully, it returns a positive acknowledgment (ACK) value of 0x10 in this field.

If an error occurs while the CSP is processing the message, the CSP returns a negative acknowledgment (NACK) value that indicates the reason for the error. Negative acknowledgements identify problems such as call processing anomalies and configuration errors. A negative acknowledgment value can be anything other than 0x10, which is reserved for positive acknowledgements.

Data

The contents of the data bytes vary for every message and response. Please refer to individual messages for data definitions.

Message Format Documentation Conventions

Checksum

The value of the *Checksum* field is the sum of the values of all header and data bytes, except for the *Frame* field. The system calculates the checksum before it uses an escape sequence, if an escape sequence is required.

This section describes the conventions used in this publication for the following:

- Byte Numbering
- Variable Number of Fields
- Word-sized Fields
- Bit Masks
- Double-Line in Table

Byte Numbering

In this Reference, the actual number of bytes in a message field is shown only if the value never changes. For example, the number of bytes in the header field is shown because the header bytes will always be 0-.

Variable Number of Fields

The number of bytes in a series often changes (for example, with variable data) so it cannot be shown in this Reference. In these cases, the first field is defined in the Reference, but subsequent fields are represented by vertical dots, as shown in below.

12	Data
:	:

Word-size Fields

API messages frequently use multiple byte fields for the following:

- Timers
- Conference IDs
- PPL Event IDs
- PPL Component IDs

Fields that are more than one byte long use the Big Endian format of Most Significant Byte (MSB) first, Least Significant Byte (LSB) last.

For example, as shown in below, Byte 8 is the MSB and Byte 9 is the LSB for the *Conference ID* field.

Byte 8	Conference ID, MSB
Byte 9	Conference ID, LSB

If the Conference ID is 05, you would enter the ID as shown in the next figure. Note that the first value (MSB) is 0x00 until the value of the LSB field “overflows” (is greater than 255). These two-byte fields are often represented as a combined Hexadecimal number. For example, in the figure below, the combined representation of 0x00 and 0x05 would be **0x0005**.

Figure 1-2 Conference ID

Bit Mask

A bit mask is a byte that uses its individual bits to enable or disable functions. Setting the bit enables the function. This process is shown in the following example, taken from the *Alarm* message:

Example:

Data[1]Span Status

This is a bit mask indicating the information that is sent and received on the span. You can set multiple bits.

Bit

0 Receiving Red

1 Receiving Remote Alarm Indication/Yellow

2 Receiving Loss of Signal

3 Receiving Out of Frame

4 Sending Red (AIS)

5 Sending Remote Alarm Indication/Yellow

6 Receiving AIS

7 Receiving constant E-bit with Remote Alarm Indication. This bit is valid for E1 with insert CRC and Euro-ISDN.

When you print a message trace, you read a two-byte bit mask from right to left, as shown below (0 to 15).

15	. . .	8	7	. . .	0
----	-------	---	---	-------	---

Double Line in Table

A double line in a table indicates that you do not repeat the fields above it. In the example below, the double line between String 1 and String 2 indicates that you can have multiple strings in the ICB but that you do not repeat the information above the field, "String 2: BCD Digit Count."

ICB Type	0x02 (Data)
ICB ID	0x01
Data Length	Variable
Data[0]	Stage Number (1–4)
Data[1]	0x01 (Host-Supplied Digits)
Data[2]	Outputting Signal Type 0x01 DTMF 0x02 MFR1 (host does not include KP or ST) 0x03 MFR2 0x04 MFR1 (host includes KP and any ST signal) 0x05 Dial Pulse
Data[3]	String Count (1 or 2)
Data[4]	String 1: BCD Digit Count
Data[5]	String 1: 1st BCD Digit Pair
:	:
:	String 1: Last BCD Digit Pair
:	String 2: BCD Digit Count
:	String 2: 1st BCD Digit Pair
:	:
:	String 2: Last BCD Digit Pair

Escape Sequences

The CSP uses the value 0xFE in the *Frame* field to indicate the beginning of a new frame. If a field value within a message or response is 0xFE, the CSP erroneously tries to process the next piece of data as a new message or response.

An escape sequence resolves this issue. Use the value 0xFD plus an extra byte that immediately follows it to send the values 0xFE or 0xFD. The table below shows the values that the system recognizes.

Value To Be Sent	Escape Sequence Values
0xFD	0xFD 0x02
0xFE	0xFD 0x01

When the CSP reads the value 0xFD within a frame, it uses the following byte to one-complement the 0xFD value. The sum of the complement byte and 0xFD produces the actual value sent.

Important! You cannot use the values 0xFE or 0xFD immediately following the initial 0xFD value.

When you calculate the length of a message that uses an escape sequence, do not include the extra byte that you added to the message. The length of a message is defined *before* the escape sequence is used.

For example, if you are sending the *Version Request* message and it includes the value 0xFE: The value of the *Length* field is the number of bytes between the *Length* and *Checksum* fields. The original length of this message is 0x. When you use the escape sequence, you add another byte to the message.

Although you added another byte to the message, you do not change the value of the *Length* field.

Frame	Length, MSB	Length, LSB	Message Type, MSB	Message Type, LSB	Reserved	Sequence Number	X	Logical Node ID	Checksum
FE	00	05	00	02	00	FD	01	01	05

Basic Message Set The primary function of the basic message set is to download the CSP Software from the host, and to query the CSP. When the CSP Software is completely downloaded, the CSP stops running from the CSP Matrix Series 3 Card firmware, and starts running from the CSP Matrix Series 3 Card RAM load. You can think of the Basic Message Set as a core group of messages.

The following messages comprise the basic message set:

- *Alarm*
- *Alarm Cleared*
- *Become Active*

- *Card Status Query*
- *Clear System Software*
- *Download Begin BRecord*
- *Download Begin SRecord*
- *Download BRecord*
- *Download Complete*
- *Download SRecord*
- *Fault Log Query*
- *Poll*
- *Poll Interval Configure*
- *Poll Request*
- *Reset Matrix*
- *TFTP Control/Query*
- *Version Request*

**API Messages Sent to the
Standby CSP Matrix Series
3 Card**

The host can send the following API messages to the standby matrix card.

- *Card Status Query (0x0083)*
- *Clear System Software (0x000C)*
- *Download Begin BRecord (0x009B)*
- *Download Begin SRecord (0x00A2)*
- *Download BRecord (0x009B)*
- *Download Complete (0x00A4)*
- *Download SRecord (0x00A3)*
- *Fault Log Query (0x0086)*
- *Poll (0x00AB) ACK*
- *Poll Interval Configure (0x009F)*
- *Poll Request (0x009E)*
- *Reset Matrix (0x009D)*
- *Version Request (0x0002)*

AddLLCCard

Type SwitchKit API message

Overview Use the *SK_AddLLCCard* message as an external application connected to the LLC. This message opens sockets to the SS7 cards on the node and sets up routing to the SS7 card.

AddLLCCard is used to create and connect pairs of card level device to the LLC. It has the ability to accommodate various card types including SS7 TCAP. Additional routing ID's can be added to the same connection by sending multiple *AddLLCCard* messages to the same IP pair and specifying a different Routing ID. By setting the action field to 0x01 (Remove Connection), it is assumed that all routing IDs on this connection will no longer be used and will therefore be removed by the LLC. For an application to maintain communication to the card, there must always be at least one routing ID configured for that IP pair.

This message cannot be used in a SwitchManager configuration file. Instead use the Add SS7TCAPCard message. SwitchManager will generate the appropriate *AddLLCCard* messages for you.

    void setReserved1(UBYTE x);

```

AddLLCCardAck

The LLC will acknowledge AddLLCCard messages with an AddLLCCardAck message.

```
AddLLCCardAck(Status=<*Response Value>,
RoutingID=    < Unique ID for Card Pair Added>,
Reserved1=    <Not currently used>);
```

Status field Possible Response Values found in the status field of an AddLLCCardAck message.

*Response Values	Action
SK_SUCCESS	SubComponent connection was successfully added to the LLC.
SK_CONNECT_IN_USE	The RoutingID specified is currently in use.
SK_DUP_IP_ADDR	One of the IP's is being used by another pair of Devices.
SK_INTERNAL_LIMIT_REACHED	The max number of subComponents has been exceeded.
SK_INTERNAL_MEM_ERROR	There was a problem allocating memory within the LLC.
SK_NODE_DOESNT_EXIST	The node id specified has not been added to the LLC via an AddLLCNode message.
SK_BAD_IP_ADDRESS	An invalid IP string was encountered
SK_NO_MESSAGE	Invalid message parameter found while processing request.

RoutingID Macros To avoid duplicate values, the routing ID for each type of sub-component card must be derived using that cards corresponding get_RoutingID macro. Macros will be defined within SK_API.h so that they are globally accessible.

Macros available for deriving RoutingID's.

CardType	Function
SK_SS7TCAP_BOARD (0x03)	getSS7TCAP_RoutingID(int stackid(0-255));

AddLLCNode

Type EXS SwitchKit API message

For the same functionality, the EXS API message is Assign Node ID (0x0010).

Purpose Use *SK_AddLLCNode* at the initial configuration of your system and to dynamically add a node while Low-Level Communicator is running.

Important! To assign a logical node ID within a CSP system, the ring must be out-of-service (OOS). Assuming the ring is OOS and the nodes already assigned, if you try to re-assign a logical node ID, the *AssignNode* messages issued on behalf of the *AddLLCNode* message will be NACKed by that node. You must have unique logical node IDs at all times within a CSP system. For example, if you have two nodes (nodes 2 and 3) and you want to re-assign logical node ID 2 to node 3 and logical node ID 3 to node 2 the *AssignNode* messages will be NACKED by the CSP and the *AddLLCNode* will ultimately fail. You will have to de-assign logical node IDs 2 and 3 first by sending a *ResetConfig* message to each of the nodes. Only then can you freely assign node IDs using the *AddLLCNode* message.

Description The *AddLLCNode* message informs the LLC of a CSP Node. It specifies the Node ID and the CSP Matrix Series 3 Card IP addresses for each node. This can be used to add, update, or delete a node. The node must already have software downloaded through TFTP. Sending *SK_AddLLCNode* for a node that needs software will fail.

CAUTION

Do not use the shared IP address that can be used for SIP and H.323 redundancy. See Configuring a Shared IP Address Using BOOTP Server in the API Developer's Guide: Overview. Use the fixed IP addresses for the matrix cards in the AddLLCNode() message. If you don't, the LLC will inaccurately reflect the state of the CSP.

Important! When LLC receives a request to connect to a node using *AddLLCNode()*, LLC will maintain that connection until a disconnect message is received. If the specified IP address is not

reachable, LLC will continue attempting the connection indefinitely. This condition will be logged in the LLC maintenance log file.

When the Switch Manager reconnects to the LLC, *AddLLCNode* messages are sent from the Switch Manager to the LLC. This causes the LLC to open a socket (connection) to the CSP and the *AssignNode* message (which is the switch-level equivalent of *AddLLCNode*) is sent to the CSP.

Sent by SwitchManager

Add a Node To add a node, you must send a configuration file with SwitchManager. The configuration file should contain at least the following information:

```
AddLLCNode (matrix1="10.10.55.10", matrix2="10.10.55.11",
             RequestedNode=0x08);
```

If you are adding a node with a single CSP Matrix Series 3 Card and you use the Matrix2 argument in your message, be sure to enter the 0-length string as its value. The configuration file should contain at least the following information:

```
AddLLCNode (matrix1="10.10.55.10", matrix2="",
             RequestedNode=0x08);
```

Arguments The following table shows the arguments you can change:

Argument	Description
Action	Specifies whether a node gets added, updated, or deleted. The values are: SK_ADD_NODE = 0 (default) SK_DELETE_NODE = 1 SK_UPDATE_NODE = 2
CallControlNode	Reserved
Matrix1	A text field corresponding to the IP address of the primary CSP Matrix Series 3 Card.
Matrix2	A text field corresponding to the IP address of the secondary CSP Matrix Series 3 Card, if it exists. If there is only one CSP Matrix Series 3 Card in the node, this field must be set to "", that is, the 0-length string.

Argument	Description
NodeType	<ul style="list-style-type: none"> • Needs to be specified for ISDN and H.323 device server nodes. NodeType = <i>SK_LSS_DS_SYSTEM</i> or 16. • Needs to be specified for EXNET Connect® nodes: NodeType = <i>SK_EXNET_SYSTEM</i> or 300. • If the above values are not used, the NodeType will default to SK_CS_SYSTEM or 200.
PhysicalNode	Reserved
RequestedNode	<p>RequestedNode is the logical node ID requested to be assigned to the new node. The API will attempt to assign this node:</p> <ul style="list-style-type: none"> • If there is no node ID currently on the node; • If it is currently assigned a different node ID. <p>It is not a guarantee that this node will be assigned. In particular, the node ID might already be in use on the ring. If so, AddLLCNode will fail, no connection will be established with the node. If the LLC is already connected to a node with the specified logical node ID, the AddLLCNode is considered an update, if treated accordingly.</p>
SeqNumWidth	<p>Determines whether a message will have two-byte sequence numbers or one-byte sequence numbers.</p> <p style="text-align: center;">A one-byte SeqNumWidth is 0xff A two-byte SeqNumWidth is 0xffff</p>
ISUPRemCon	<p>Specifies whether SS7 cards can act as though they are on a ring, even if they are not. The values are:</p> <p>If set to 0, a multi-node system must have an EXNET® (ring) card.</p> <p>If set to 1, forces the system to act as if it is a multi-node system even when there is no EXNET® (ring) card in the CSP.</p>

Configuration AddLLCNode (
Node = integer,
ConnectionID = integer,
Matrix1 = string,
Matrix2 = string,

AddLLCNode

```
RequestedNode = integer,  
Action = integer);
```

```
class SKC_AddLLCNodeAck : public SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
    int getActualNode() const;
    void setActualNode(int x);
    UBYTE getDownloadStatus() const;
    void setDownloadStatus(UBYTE x);
};
```

AddSS7TCAPCard

Type EXS SwitchKit API message

Overview The *AddSS7TCAPCard* message is used to make a direct TCP connection between the LLC Host and a SS7 card for the purpose of routing TCAP traffic on a separate link. This message creates the appropriate AddLLCCard messages and sends them to the LLC.

Sent by Host, using Converged Services Administrator (CSA), webCSA or SwitchManager configuration file.

Arguments The following table shows the arguments that you can modify:

Argument	Description
CardIP1	The primary SS7 card IP address in the CSP.
CardIP2	The standby SS7 card IP address, if it exists. If there is only one SS7 card in the node, this field should be set to "", that is, the 0-length string.
StackID	The ID of the TCAP stack to which the LLC connects.
SSN	The Subsystem Number configured on the SS7 card to which the LLC should connect.
ControlNode	The logical node ID assigned to the CSP Matrix Series 3 Card which controls the chassis where the SS7 card resides.
Action	0x00 To add a connection 0x01 To remove a connection and all RoutingIDs

C Structure

```
typedef struct {
    char CardIP1[30];
    char CardIP2[30];
    UBYTE StackID;
    UBYTE SSN;
    int ControlNode;
    UBYTE Action;
    UBYTE reserved84[5];
} SK_AddSS7TCAPCard;
```

C++ Class `class SKC_AddSS7TCAPCard : public SKC_DummyMessage {`

```
public:  
    const char *getCardIP1() const;  
    void setCardIP1(const char *x);  
    const char *getCardIP2() const;  
    void setCardIP2(const char *x);  
    UBYTE getStackID() const;  
    void setStackID(UBYTE x);  
    UBYTE getSSN() const;  
    void setSSN(UBYTE x);  
    int getControlNode() const;  
    void setControlNode(int x);  
    UBYTE getAction() const;  
    void setAction(UBYTE x);
```

AdjustMessageTimeout

Type	EXS SwitchKit API message
Purpose	Use the <i>SK_AdjustMessageTimeout</i> message to change the default time-out for responses.
Description	<p>SwitchKit allows all requests to the CSP a fixed amount of time to complete before the request is considered timed out. For most messages, this time is 15 seconds which is often acceptable for these SwitchKit-defined time-outs. However, there are times when the time-out specified is insufficient. In particular, when several time consuming messages are sent to the same node simultaneously, the time to complete a request can increase due to latency within the CSP. These increased delays occur primarily during configuration time.</p> <p>The <i>AdjustMessageTimeout</i> message increases the time-out for all messages by <i>TimeoutIncr</i>. In other words, if an application requested that the time-out be adjusted by 10 seconds, the time-out on most messages sent by that application would become 25 seconds. Messages that have a larger default time-out would have their time-out increased by the same 10 seconds.</p> <p>You must set the <i>Action</i> field for <i>SK_AMT_ACTIVATE_TIMEOUT</i>, to activate a new time-out. To set this new time-out for all applications connected to the LLC, set the <i>NumApps</i> field to <i>SK_ALL_APPS</i>. If you attempt to set a new time-out for only one application, don't set the <i>NumApps</i> field.</p> <p>You can reset the time-out by setting the <i>Action</i> field to <i>SK_AMT_DEACTIVATE_TIMEOUT</i>.</p>
Sent by	Application
Arguments	The following table shows the user modifiable arguments of the <i>AdjustMessageTimeout</i> message:

Argument	Description
Action	Action specifies whether a new timeout gets activated or deactivated.
TimeoutIncr	TimeoutIncr specifies the amount of time added to the prior timeout value.
NumApps	NumApps specifies whether the new timeout gets set for only one or all messages.

Configuration *AdjustMessageTimeout* (
Node = integer,
ConnectionID = integer,
Action = integer,
TimeoutIncr = integer,
NumApps = integer);

C Structure typedef struct {
 UBYTE Action;
 unsigned short TimeoutIncr;
 UBYTE NumApps;

Alarm 0x00B9

SwitchKit Name Alarm

Type EXS API and SwitchKit API message

Description **Alarm 0x00B9**

The CSP sends Alarm 0x00B9 message to indicate that an alarm condition has been detected. The following information is reported:

- Severity
- Alarm Type
- Alarm Number
- Alarm Data

Alarm Cleared

In some cases, the CSP sends an *Alarm Cleared* message after the alarm condition ceases. The alarms that are followed by an *Alarm Cleared* message are marked with an asterisk (*).

Related Messages Alarm Cleared (AlarmCleared) 0x00C1

Sent by CSP

SwitchKit Code **C Structure**

```

0x01 General Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x01*	System busy condition The CSP sends this alarm when the CSP Matrix Series 3 Card is flooded with messages. The CSP will ignore all incoming calls until the alarm is cleared.	0x00	The system ignores incoming calls until the alarm is cleared. Ignoring incoming calls decreases the traffic load and eventually the alarm will clear. Ensure that System Busy Warning messages are no longer being seen. Slowly ramp traffic back to normal levels and resume normal operation.

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
<p>Major: Default</p> <p>Minor: If clock mode was switched to REF1 or REF2.</p>	0x02	Clock mode switched	0x02	<p>The system automatically switches the clock mode to the next available clock source and reports the following data to the host:</p> <p>Data[0] - Current Synchronization Mode Data[1] - Previous Synchronization Mode</p> <p>Values for Data[0] and Data[1] fields:</p> <p>0x01 Primary Reference Clock Signal 0x02 Secondary Reference Clock Signal 0x03 Primary Loop Clock Signal 0x04 Secondary Loop Clock Signal 0x05 Free Running Clock Signal</p> <hr/> <p>This notification occurs when the clock mode was automatically switched or reference clock sources have been lost.</p> <p>The CSP will automatically set the clock mode to the next available clock source.</p> <p>Either a master timing source has been disconnected or gone bad, or a span signal has been lost.</p> <p>Investigate why the signal has been lost and try to restore it if possible. This signal may be controlled by the network in which the Loop timing is dependent.</p>
Inform.	0x03	Hardware cannot support DSP function		Verify the correct card type.
Major	0x04*	Reference 1 Clock Source Lost No host intervention is needed. The CSP will automatically switch the clock mode to the next available clock source.	0x00	<p>The system automatically switches the clock mode to the next available clock source.</p> <p>The Reference Clock Source has been lost. No host intervention is needed for this occurrence. The CSP will automatically switch the clock mode to the next available clock source.</p> <p>Have Operational Personnel Check to see what happened to the External Timing Source Connected the CSP Matrix I/O.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x05*	Reference 2 Clock Source Lost No host intervention is needed. The CSP will automatically switch the clock mode to the next available clock source.	0x00	<p>The system automatically switches the clock mode to the next available clock source.</p> <p>The Reference Clock Source has been lost. No host intervention is needed for this occurrence. The CSP will automatically switch the clock mode to the next available clock source.</p> <p>Have Operational Personnel Check to see what happened to the External Timing Source Connected the CSP Matrix I/O.</p>
Major	0x06	DSP Resource Blocked	0x01	Data[0] DSP Function Type
Major	0x06	DSP Resource Blocked	0x04	<p>Data[0] Slot where VRA Block occurred Data[1] Chain across SIMMs Data[2-3] RAN ID blocked</p> <hr/> <p>The CSP will send this alarm when all the resources of the particular resource type are all in use. The request to use a specific resource is placed in a queue until there is a resource of the alarmed type freed. The request is placed in a queue waiting for a resource to free unless a <i>DSP Service Cancel</i> (0x00BE) message is send by the host or the channel that the resource was requested on is release.</p> <p>See the DSP SIMM Configure (0x00C0) message in the API Reference and the <i>CSP Developer's Guide: Overview</i> for details on DSP function types.</p> <p>Either wait for the resource requested to free up which is the most likely response. Send a <i>DSP Service Cancel</i> (0x00BE) message. Release the channel that the resource was requested on. If you find that the CSP is reporting a large number of these alarm it maybe a good idea to re-evaluate the number of resources per function type you have configure. You may need to increase the number of configured functions type.</p>

Alarm 0x00B9

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x07	DSP Resource Function Type Not Configured	0x02	<p>Data[0] Resource Type Data[1] Resource Type 2 (0x00 if no second resource type)</p> <hr/> <p>The DSP function type requested is not configured and will need to be configured in order to use the resource being requested.</p> <p>Can also indicate a function is configured but the SIMM is out-of-service.</p> <p>See the DSP SIMM Configure (0x00C0) message in the <i>API Reference</i> and the <i>CSP Developer's Guide: Overview</i> for details on DSP function types.</p> <p>Configure the DSP function type for the resource being requested.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x08	<p>DSP Resource Management Inconsistent. (An internal task has asked to attach the same type of DSP resource to a single timeslot twice. This Alarm is sent when:</p> <ul style="list-style-type: none"> - A receiver has been requested but a Call Progress or Digit receiver for the same layer is already attached to the timeslot - A transmitter has been requested but a Digit or Recorded Announcement transmitter for the same layer is already attached to the timeslot 	0x09	<p>Data[0-6] 0x0D Channel AIB (Dialogic use only)</p> <p>Data[7] Process Virtual Identifier (The process that requested the DSP service. Inform.	0x0A	Partial Message Received (for example, incorrect checksum, zero length message, or message did not begin with frame character)	0x00	<p>Partial Message Received (for example, incorrect checksum, zero length message, or message did not begin with frame character)</p> <p>Collect the socket.log, alarm.log, maintenance_llc_xxx.log and a list of the applications running on the system and contact Dialogic Technical Support.</p>
	0x0B	RAN Requested is Unavailable in System		<p>Check if this announcement was reached in error. Check in the Vocabulary Index File to see if the file ID is listed there. If it is not listed, then report the problem to Dialogic Technical support along with socket.log, alarm.log, and timestamp of when the trap occurred.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x0C	<p>Unacknowledged Message</p> <p>If you configured the system's message resend logic to "Resend Once and Generate <i>Alarm</i>," these data fields contain the bytes of the resent message. For more information, refer to the <i>System Configuration</i> message.</p>	Variable	<p>Data[0-N] The bytes of the message</p> <hr/> <p>Check for other error messages that would indicate a network or system condition leading to this problem.</p>
Major	0x0D	<p>Recorded Announcement ID Inconsistency</p>	0x04	<p>Data[0] Slot Number Data[1] SIMM Number Data[2, 3] RAN ID</p> <hr/> <p>Sent upon completion of download or on card Insertion. This alarm indicates that an announcement being downloaded has the same ID as an existing announcement, but with different information.</p> <p>When the ID is specified in the <i>Recorded Announcement Connect</i> message, either announcement could be played. Each RAN must have a unique ID. One of the announcements (usually the older one) should be deleted. A Query addressed to one RAN ID returns information for only one of the RANs that share the ID. It is not possible to determine for which RAN the information will be returned.</p> <p>For example, if one file sharing the ID is 20 Kb and one file is 40Kb, only one of the sizes is reported, either 20 Kb or 40 Kb, but not both.</p>
Minor	0x0E	<p>SS7 Signaling Network Congestion</p> <p>When a route to a destination is congested, MTP sends the MTP_STATUS to ISUP which in turn sends this alarm to the host.</p>	0x06	<p>Data[0] SS7 Stack ID Data[1-4] DPC Data[5] Congestion Level</p> <hr/> <p>Decrease the load or create a new route to the destination. If the system has not decreased the call load and this symptom persists, check the network engineering plan to possibly create a new route to the destination.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x0F*	SS7 Remote ISUP Unavailable	0x05	<p>Data[0] SS7 Stack ID Data[1-4] DPC</p> <hr/> <p>SS7 Remote ISDN User Part (ISUP) unavailable. The address information represents the SS7 stack and Destination Point Code (DPC).</p> <p>Check the status of the Links and see if they are in service by sending the <i>SS7 Signalling Link Query</i> (0x0065) message. If they are not in service, attempt to determine why the links are Out Of Service. Make sure that they are marked in service from a host perspective using the <i>Service State Configure</i> (0x000A) message. Also check the status of the SS7 Signalling Routes using <i>SS7 Signalling Route Query</i> (0x0066). If the routes are unavailable, contact your SS7 service provider and ask why they are not in service.</p> <p>Also check the status of layer 1 span using <i>Span Status Query</i> (0x0084) message. This will tell you if the span is in sync, and if not how many slips and errors occurring on the physical span.</p>
Major	0x10	Node ID Already Exists	0x00	Check configuration and/or installation for correction.
Inform.	0x11	Invalid Message Length	0x00	<p>The application software sent a message with an invalid length field.</p> <p>Provide the application development team and Dialogic Technical support with the socket.log and the information from the trap.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Major	0x12	System Busy Warning	0x00	<p>This notification indicates that the traffic volume on the CSP is approaching its capacity. This message is only a warning. It does not mean a System Busy condition will definitely occur. The System Busy Warning does not have a clearing Alarm. It continues to occur every few seconds, until the CPU utilization reduces. The System Busy Warning messages can be between 2 and 20 seconds apart, depending on system load fluctuations.</p> <p>The EXS CSP CPU occupancy has exceeded the "System Busy Warning" threshold. This condition can happen due to traffic congestion or CSP configuration during high traffic or by having Debug printing enabled on a CSP card or cards.</p> <p>When a System Busy Warning is generated, the Host should reduce the number of new calls until the System Busy Warning messages cease. Whenever possible, ramp call rates up slowly and evenly to prevent an initial System Busy. Do not re-configure the CSP and do not enable unnecessary diagnostics.</p> <p>For more information on this alarm, refer to the CSP Developer's Overview Guide, Chapter 4 EXS API Application Development, section System Busy Warning and System Busy Alarm.</p>
Inform.	0x13	Resource Utilization Threshold Reached	0x01	<p>Data[0] Free Conferencing Timeslots (0x01)</p> <hr/> <p>This normally occurs during high traffic and high utilization of conference resources.</p> <p>Calculate the number of free timeslots available for EXS Conferencing using the System Resource Usage Query. Determine if free timeslots need to be made available. For complete information see CSP Conferencing Section in the <i>Configuring Multi-Node Systems of the Developer's Guide: Overview</i>.</p>

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
	0x14	Subrate Resources Unavailable		<p>The subrate resource (channels) provided by the SRC card are no longer available as (possibly) the card has been removed.</p> <p>Find out what the Subrate Card Status is and take actions depending on the result.</p> <p>Reset or change the card. If that does not work, contact Dialogic Technical Support.</p>
Major	0x15	SS7 Remote TUP Unavailable	0x05	<p>Data[0] SS7 Stack ID Data[1-4] DPC</p> <hr/> <p>Bring remote Telephone User Part in service.</p>

0x02 Card Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
	0x01	Card Taken Out of Service	Variable	0x01 Slot AIB Check with operations personnel to verify card removal. Once card is brought in service, the CSP sends the <i>Alarm Cleared</i> message (0x00C1).
Major	0x02	Unable to Allocate Timeslots for this Card	0x05	0x01 Slot AIB Verify that the CSP contains the required number of available timeslots for this card. If sufficient timeslots are available, contact Dialogic Technical Support.
	0x03	Card Download is Corrupt	0x05	0x01 Slot AIB Reseat the card. Try a different card. Try a different software load. If all above options fail, contact Dialogic Tech Support.
Major	0x04	Card Type Not Recognized	0x05	0x01 Slot AIB Check the TFTP server and the tftp configuration file to make sure the card being used is included. Contact Dialogic Technical Support.
-	0x05	Reserved		
-	0x06	Reserved		
Inform.	0x07	Card's Configuration has been Reset to Defaults	0x05	0x01 Slot AIB One of the following occurred: Card has been reset by the host/switchkit. Card has reset/faulted due to software error. Card has reset due to a hardware problem. If running Switchkit, Switchmgr will take care of reconfiguring the card. If not using Switchkit the host has to reconfigure the card.
-	0x08	Reserved		
Major	0x09	Card Reset	0x05	0x01 Slot AIB Card has either faulted (software error) or was manually reset (either via software or via push button reset) The card should come back in service by itself.
	0x0A	Connection Map Failure	0x05	0x01 Slot AIB

Alarm 0x00B9

Major	0x0B	Software Does Not Have Download for Card	0x05	0x01 Slot AIB <hr/> Software cannot be downloaded to the card. Check the TFTP server and the tftp configuration file to make sure the card being used is included. Contact Dialogic Technical Support.
Major	0x0C	Card Does Not Support A-Law Encoding Format	0x05	0x01 Slot AIB <hr/> Card does not support A-law encoding format. Check the card type and the card configuration.
Major	0x0D	Card Revision Not Supported by System Software	0x05	0x01 Slot AIB <hr/> Card revision not supported by system software revision. Replace the card with a different REV card. The REV can be found on the card itself and is made of a letter and a two digit number (for example, C12). The higher letter/number the newer the REV.
Major	0x0E	Card Removed	0x05	0x01 Slot AIB <hr/> Check with operations personnel to verify card removal.
Major	0x0F	Hardware Failure Occurred on Slot Specified The CSP also sends a <i>Card Status Report</i> with a description of the failure	0x05	0x01 Slot AIB <hr/> A hardware failure has been detected on a card. Reseat the card. If that does not work, replace card.
Minor	0x10	Ethernet Host Link Error Detected NOTE: To use the Host Link Failure Detection feature and receive this message, you must have polling enabled.	0x00	
Major	0x11	Card or Fan Tray Not Installed in Chassis	0x05	0x01 Slot AIB <hr/> Check if fan tray and card are installed.

Major	0x12	EXNET Port A - Communication Failure	0x08	<p>Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status</p> <hr/> <p>Hardware failure on EXNET Port A.</p> <p>The Remote Node terminating to the local EXNET® Port A is not accessible (that is, the problem is not with local node but with the remote node).</p> <p>Verify EXNET Port A's terminating connection (remote node) is accessible.</p> <p>There could be a faulty fiber cabled connected to EXNET Port A. Check fiber connections are snug and connected properly.</p> <p>Bring the ring out of service then back in service. Reset Ring Interface card.</p> <p>If the lights on the Ring Interface card are still not all green, then collect the socket.log,alarm.log, and maintenance_llc_xxx.log and contact Dialogic Technical Support.</p>
Minor	0x13	EXNET Port B - Communication Failure	0x08	<p>Data[0-4] Slot AIB Data[5] Logical Ring ID Data[6] Host Service State Data[7] EXNET Ring Error Status</p> <hr/> <p>Hardware failure on EXNET Port B</p> <p>The Remote Node terminating to the local EXNET® Port B is not accessible (that is, the problem is not with local node but with the remote node).</p> <p>There could be a faulty fiber cabled connected to EXNET® Port B. Check fiber connections are snug and connected properly.</p> <p>Verify EXNET® Port B's terminating connection (remote node) is accessible.</p> <p>Bring the ring out of service then back in service. Reset Ring Interface card.</p>
Minor	0x14	EXNET Port A - Fiber Laser Failure	0x05	<p>0x01 Slot AIB</p> <hr/> <p>Refer to the <i>Hardware Installation and Maintenance Guide</i>.</p>

Alarm 0x00B9

Minor	0x15	EXNET Port B - Fiber Laser Failure	0x05	<p>0x01 Slot AIB</p> <hr/> <p>The fiber driver on the Ring interface card has gone bad.</p> <p>Contact Dialogic Technical Support and replace the Ring Interface Controller card.</p>
	0x16	Subrate Card Switchover		A switchover has occurred. No action required.
Inform.	0x17	Software Error (Please report this error to Dialogic Technical Support)	Variable	<p>0x01 Slot AIB</p> <p>Data[0] Address Method (0x00)</p> <p>Data[1] Number of Address Elements (0x01)</p> <p>Data[2] Address Type (0x01)</p> <p>Data[3] Data Length (0x01)</p> <p>Data[4] Slot Number</p> <p>Data[5-44] Filename (in ASCII)</p> <p>Data[45,46] Line Number</p> <p>Data[47-n] Diagnostic Data</p> <hr/> <p>A software error occurred on a line card. 0x05 DSP SIMM Alarms

Severity	Alarm (Number/Name)		Data Length	Data/Troubleshooting
Inform.	0x01	DSP SIMM Taken Out of Service	0x06	<p>0x12 DSP SIMM AIB.</p> <p>Check with operations personnel to verify card removal.</p> <p>Verify the host did not send a <i>Service State Configure</i> (0x000A) message to take the SIMM out of service. Also verify that the DSP card is still installed and powered on.</p>
-	0x02	Reserved	0x00	No Data

Alarm 0x00B9

Inform.	0x03	Recorded Announcement Erase Complete	0x00	No Data Sent upon completion of erasure. When you have erased a VRA SIMM using <i>Recorded Announcement</i> (0x0054), this alarm indicates that the erasure is complete. The host must wait for this alarm before it begins any download.
---------	------	--------------------------------------	------	--

Major	0x04	Recorded Announcement Download Inconsistency	0x00	<p>No Data</p> <p>Sent upon completion of download. This alarm indicates an inconsistency between the information in a <i>Recorded Announcement Download 0x0052</i> message and the actual announcement in the <i>Recorded Announcement Download 0x0053</i> message. The inconsistency is usually caused by an incorrect checksum or announcement size. The announcement information is stored as it appears in the <i>Recorded Announcement Download 0x0053</i> message. Play out the announcement to check it.</p> <p>Could be caused by an incorrect checksum or announcement size. Check the announcement and delete one of the announcements.</p>
Major	0x05	Recorded Announcement ID Inconsistency (on same card)	0x00	<p>No Data</p> <p>Sent when a VRA SIMM is brought in service. This alarm indicates that an announcement uses the same ID as another announcement, with different information, on the DSP card. Both announcements have the same ID, and either announcement might be played when the ID is specified in the <i>Recorded Announcement Connect 0x0055</i> message.</p> <p>Indicates that the host downloaded an announcement using the same ID as another announcement, with different information on the DSP card.</p> <p>Check the configuration to ensure that you are not using the same ID for different RAN files.</p>
Inform.	0x06	Recorded Announcement Download Ready	0x08	<p>An AIB indicating the slot number:</p> <p>Data[0] Address Method (0x00) Data[1] No. of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6, 7] RAN ID</p> <hr/> <p>Sent upon completion of download. The DSP-ONE card will not accept another Recorded Announcement Download Initiate message until it has sent this alarm.</p>

Inform	0x07	Recorded Announcement File System Conversion Success	0x06	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number</p> <hr/> <p>Sent after the flash memory file system is converted. Informs the host that the RANs are now stored in the requested file system.</p> <p>This alarm takes three to five minutes to be generated after the host sends the file system conversion request.</p> <p>After this alarm you are able to bring the VRAS simm into service.</p>
Major	0x08	Recorded Announcement File System Conversion Failure	0x07	<p>Data Length: (0x07) Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6]:Failure Code</p> <hr/> <p>Failure codes: VRA_FAILURE = 0, Amount of Flash Data invalid for New File System.</p> <p>VRA_FLASH_WRITE_FAILURE = 2, Writing to Flash failed.</p> <p>VRA_FLASH_ERASE_FAILURE = 3, Erasing Flash failed.</p> <p>VRA_RAM_WRITE_FAILURE = 4, Writing RAM failed.</p> <p>VRA_DATA_VALIDATION_FAILURE = 5 CRC validation failed.</p> <p>Sent after an unsuccessful attempt to convert the file system. Informs the host that the file system conversion process failed. You should delete the RANs on this VRA SIMM.</p> <p>If the file system convert fails then delete all RANs from this SIMM and try again.</p>

Alarm 0x00B9

Major	0x09	Recorded Announcement File System Timeout	0x06	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number</p> <hr/> <p>Sent after an attempt to convert the file system times out, if the attempted deletion of entire flash memory, file system conversion, or defragmentation fails to complete in the time allowed.</p> <p>Try deleting each RAN from the SIMM.</p>
Inform	0x0B	Recorded Announcement Defragmentation Success	0x06	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number</p> <hr/> <p>Sent after defragmentation of the flash memory is complete. Informs the host that the RANs now take up as little flash memory as possible.</p> <p>This alarm takes three to five minutes to be generated after the host sends the file system Defragment request.</p>
Major	0x0C	Recorded Announcement Defragmentation Failure	0x07	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] Failure Code (see failure codes listed under Alarm File System Conversion Failure 0x08)</p> <hr/> <p>Sent after an unsuccessful attempt to defragment flash memory. Informs the host that the flash memory defragmentation has failed. The host should delete the flash memory on this VRA SIMM.</p>

Alarm 0x00B9

Inform	0x0D	Recorded Announcement Single Deletion Complete	0x08	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] RAN ID (MSB) Data[7] RAN ID (LSB)</p> <hr/> <p>Sent in response to the message, <i>Recorded Announcement Single Delete</i>. Informs the host that the RAN ID has been marked for deletion and is no longer available for use.</p> <p>This alarm takes zero to 30 seconds to be generated after the host sends the delete request.</p>
Inform	0x0E	Recorded Announcement Need Defragmentation	0x07	<p>Data[0] Address Method (0x00) Data[1] Number of Address Elements (0x01) Data[2] Address Type (0x12) Data[3] Data Length (0x02) Data[4] Slot Number Data[5] SIMM Number Data[6] Defragmentation Level</p> <hr/> <p>Sent after a Recorded Announcement Single Delete has been processed and the flash memory where the RANs are stored has reached the highest level of fragmentation. Indicates that enough of the flash memory is occupied by deleted RANs to make it worthwhile to defragment the flash memory.</p>

Inform.	0x02	Available Conferencing Timeslot Changed	0x02	Data[0] New Timeslot Count, MSB Data[1] New Timeslot Count, LSB
Inform.	0x05	Unable to Communicate with Node		Normally when this alarm is sent to the host, it includes the filename and line number where the error occurred. Send this information to Dialogic Technical Support.
Major	0x06	Remote SS7 Server Node Unavailable		Data[0] Node ID Data[1] Board Slot Number Check with network operations for other network alarms that could be related.
	0x07	0x07 Remote SS7 CIC Matrix Node Unavailable		Check with network operations for other network alarms that could be related.
Major	0x08	Remote SS7 Card Unavailable		Data[0] Number of IDs (always 1) Data[1] 1=Active SS7 Card 2=Standby SS7 Card Ensure that the Ethernet cable is plugged in CCS I/O Ethernet Port A. Check for faulty hardware, (SS7PQ, SS7HP, CCS I/O, ethernet cable, and Ethernet switch). Check with network operations for other network alarms that could be related.
Major	0x0A	Maximum Node Count Reached		
Major	0x0B	H.100 Bus Failure		This alarm occurs if the H.100 bus fails. For example, if there are no clock signals to drive the H.100 bus.
Major	0x0C	Clock B Failure		This alarm occurs if the clock B signal of the H.100 bus fails. This alarm notifies the host about the clock signal failure, so that the host can appoint another board to source the clock or take other actions.

Alarm 0x00B9

Major	0x0D	Clock A Failure		This alarm occurs if the clock A signal of the H.100 bus fails. This alarm notifies the host about the clock signal failure, so that the host can appoint another board to source the clock or take other actions.
Major	0x0E	Cannot Be Primary A		This alarm occurs when the board could not become the primary master driving clock A, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as primary master driving clock A or take other actions.
Major	0x0F	Cannot Be Primary B		This alarm occurs when the board could not become the primary master driving clock B, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as primary master driving clock B or take other actions.
Major	0x10	Cannot Be Secondary A		This alarm occurs when the board could not become the secondary master driving clock A, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as secondary master driving clock A or take other actions.
Major	0x11	Cannot Be Secondary B		This alarm occurs when the board could not become the secondary master driving clock B, when instructed to do so. This alarm is sent to the host to enable it to appoint another board as secondary master driving clock B or take other actions.
Major	0x12	Momentary Failure of Clock A		This alarm occurs when a momentary failure of clock A is observed and clock A recovers.
Major	0x13	Momentary Failure of Clock B		This alarm occurs when a momentary failure of clock B is observed and clock B recovers.
Major	0x14	Taking Over As Primary A		This alarm occurs when the board is acting as the secondary master, driving clock A and the primary master, driving clock B fails. Since the primary master, driving clock B has failed, the secondary master driving clock A takes over as the primary master, driving clock A. The board is taking over as the primary master driving clock A.

Alarm 0x00B9

Major	0x15	Taking Over As Primary B		This alarm occurs when the board is acting as the secondary master, driving clock B and the primary master, driving clock A fails. Since the primary master, driving clock A has failed, the secondary master driving clock B takes over as the primary master, driving clock B. The board is taking over as the primary master driving clock B.

0x1E TFTP Alarm

NOTE: This alarm is resent every 20 seconds as long as the alarm condition remains

Length Variable

Data[0] Alarm Code

- 0x00 Cannot TFTP file
- 0x01 Invalid TFTP Configuration File Format
- 0x02 Invalid BRecord Format
- 0x03 RAM Corrupted
- 0x04 Old Timestamp
- 0x05 No timestamp supplied

Data[1] Type

- 0x02 Alarm Status (See Data[2], below)
- All other types: Dialogic Use Only. Report to Dialogic Technical Support.

Data[2] Status

Applies to Alarm Type 0x02 (Alarm Status) only.

- 0x00 No Status
- 0x01 TFTP device detected a protocol error
(such as a non-Data packet received or expected ACK not received. Occurs when a file is not found).
- 0x02 TFTP device timed out (Incorrect IP Address)
- 0x03 TFTP device is out of sync
- 0x04 TFTP device has no more free socket IDs
(Occurs when another TFTP Download was in progress but was aborted)
- 0x05 TFTP device cannot use a channel number given to it
- 0x06 TFTP device has not been initialized
- 0x07 No server IP Address has been given
- 0x08 No TFTP Configuration filename has been given
- 0x09 No timestamp has been given
- 0x0A A TFTP Configuration or BRecord File line is too long
- 0x0B Too much data for internal buffer
- 0x0C TFTP Configuration File line has no '='
- 0x0D TFTP Configuration File line has no second '='
- 0x0E TFTP Configuration File timestamp is missing a parameter
- 0x0F Load filename is greater than 127 characters
- 0x10 EX/CPU Label in TFTP Configuration file not set to SAVE_LOAD_TRUE
- 0x11 Not enough RAM on EX/CPU card to save all loads that are configured to be saved
- 0x12 BRecord File is out of sync. There is no 'B' starting the record.
- 0x13 BRecord receiver is out of sync. Expected a different record type.
- 0x14 Invalid BRecord Checksum
- 0x15 Invalid BRecord Count
- 0x16 Incorrect Number of Bytes in BRecord Load

Alarm 0x00B9

- 0x17 Invalid Load Checksum
- 0x18 Incorrect Load for Card
- 0x19 Load is from a different software version than the version on the EX/CPU
- 0x1A Timeout waiting for response from internal download process
- 0x1B Host download is in progress
- 0x1C TFTP Download aborted by initiation of host download
- 0x1D Timeout waiting for buffer
- 0x1E Stopped by host starting another TFTP
- 0x1F Configuration file has a new save option for an existing load
- 0x20 Operating system general error
- 0x21 Operating system I/O error

Data[3] Load Number

- 0x00 ST1LC
- 0x01 EX/CPU
- 0x02 MFDSP
- 0x03 Reserved
- 0x04 SE1LC
- 0x05 SJ1LC
- 0x06 SS7
- 0x07 ISDN PRI, DASS2/DPNSS
- 0x09 DSP-ONE
- 0x0B T-ONE, E-ONE
- 0xFF No Load

Data[4] Error Information

- 0x00 No Error
- 0x01 Battery-backed configuration validation
- 0x02 System data validation
- 0x03 Input parameter validation
- 0x04 TFTP device initialization
- 0x05 TFTP device open
- 0x06 TFTP device read
- 0x07 TFTP device control
- 0x08 Loading Configuration File
- 0x09 Validating Configuration File
- 0x0A Loading Load Information
- 0x0B Validating Load Information
- 0x0C Sending "Begin" to download the state machine
- 0x0D Sending BRecord to download the state machine
- 0x0E Verifying TFTP completion
- 0x0F Sending "Complete" to download the state machine
- 0x10 Sending data buffer to line card
- 0x11 Verifying data for line card completion
- 0x21 Host Connection Dropped (Major) (Indicates that a connection to a host has been dropped)

PPL Error Data

The data format for this alarm depends on the PPL component
E1/T1 Components:

Length	0x 14
Data[0]	Component ID, MSB
Data[1]	Component ID, LSB
Data[2]	Logical Span ID
Data[3]	Channel
Data[4-10]	The Channel AIB
Data[4]	Address Method (0x00)
Data[5]	Number of Address Elements (0x01)
Data[6]	Address Type (0x0D)
Data[7]	Data Length (0x03)
Data[8]	Logical Span ID, MSB
Data[9]	Logical Span ID, LSB
Data[10]	Channel
Data[11]	PPL Protocol ID
Data[12]	Blocked
Data[13]	PPL Event, MSB
Data[12]	PPL Event, LSB
Data[14]	Initial State
Data[15]	Next State
Data[16]	Timestamp, MSB
Data[17]	Timestamp, LSB
Data[18]	Error Status, MSB
Data[19]	Error Status, LSB

See "PPL Audit Query 0xDD" for values of the various PPL bytes.

ISDN and DASS Components:

Length	0x 1A
Data[0]	Component ID, MSB
Data[1]	Component ID, LSB
Data[2]	Logical Span ID
Data[3]	Channel
Data[4-10]	The Channel AIB
Data[4]	Address Method (0x00)
Data[5]	Number of Address Elements (0x01)
Data[6]	Address Type (0x0D)
Data[7]	Data Length (0x03)
Data[8]	Logical Span ID, MSB

Data[9]	Logical Span ID, LSB
Data[10]	Channel
Data[11]	Subrate
Data[12]	Call Reference, MSB
Data[13]	Call Reference, LSB
Data[14]	Reserved
Data[15]	Reserved
Data[16]	PPL Protocol ID
Data[17]	Blocked
Data[18]	PPL Event, MSB
Data[19]	PPL Event, LSB
Data[20]	Initial State
Data[21]	Next State
Data[22]	Timestamp, MSB
Data[23]	Timestamp, LSB
Data[24]	Error Status, MSB
Data[25]	Error Status, LSB

See "PPL Audit Query 0xDD" for values of the various PPL bytes.

SS7 Components:

Length	Variable
Data[0]	Component ID, MSB
Data[1]	Component ID, LSB

10	Alarm Number		
11	Data Length (n)		
12	Data[0]		
:	Data[n]		
:	Checksum		

AllInService

Type	SwitchKit API message
Purpose	Use the <i>SK_AllInService</i> message to automatically bring into service all entities referenced in the configuration file.
Description	This message is for SwitchManager configuration files. It instructs SwitchManager to bring into service any entity referenced in configuration files using <i>ServiceStateConfig</i> . AllInService saves you from having to explicitly add <i>ServiceStateConfig</i> messages for each single entity.
Sent by	SwitchManager
Configuration	<i>AllInService</i> (Node = integer, ConnectionID = integer);

AllocateChannel

Type	SwitchKit API message
Description	Use the <i>SK_AllocateChannel</i> message to manually allocate a channel outside of the standard automatic allocation functions (for example, sk_watchChannelGroup() and sk_requestOutseizedChannel()). Regardless of the channel groups that the channel is in, the LLC tries to allocate the channel specified by Span and Channel to the calling application. On success, the return Status value contains 0x00. If the channel is already allocated to another application, Status contains SK_NO_CHANNELS.
Sent by	Application
C Structure	<pre>typedef struct { unsigned short Span; UBYTE Channel; } SK_AllocateChannel;</pre>
C Structure Response	<pre>typedef struct { int Status; } SK_AllocateChannelAck;</pre>
C++ Class	<pre>class SKC_AllocateChannel : public SKC_ToolkitMessage { public: unsigned short getSpan() const; void setSpan(unsigned short x); UBYTE getChannel() const; void setChannel(UBYTE x); };</pre>
C++ Class Response	<pre>class SKC_AllocateChannelAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); };</pre>

AllocateChannelGroup

Type	SwitchKit API message
Description	Use the <i>SK_AllocateChannelGroup</i> message to manually allocate all available channels in a given channel group. If <i>GroupName</i> is not valid, then <i>Status</i> in the acknowledgment contains <i>SK_INVALID_GROUP</i> . Otherwise, it contains 0x10, and <i>Channels</i> contains a list of all the channels that have been allocated. <i>Channels[0-1]</i> will contain the first span, <i>Channels[2]</i> will contain the first channel offset, and so on, for as many channels as are specified in <i>NumChannels</i> .
Sent by	Application
C Structure	<pre>typedef struct { char GroupName[50]; UBYTE reserved67[203]; } SK_AllocateChannelGroup;</pre>
C Structure Response	<pre>typedef struct { int Status; int NumChannels; UBYTE Channels[245]; } SK_AllocateChannelGroupAck;</pre>
C++ Class	<pre>class SKC_AllocateChannelGroup : public SKC_ToolkitMessage { public: const char *getGroupName() const; void setGroupName(const char *x); };</pre>
C++ Class Response	<pre>class SKC_AllocateChannelGroupAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); int getNumChannels() const; void setNumChannels(int x); const UBYTE *getChannels() const; UBYTE *getChannels(); void setChannels(UBYTE *x); };</pre>

AllOutOfService

Type	SwitchKit API message
Purpose	Use the <i>SK_AllOutOfService</i> message to automatically take all referenced entities out-of-service on any configured node prior to sending another configuration.
Description	<p>SwitchManager takes all entities found on any configured node out-of-service after receiving this message. Sending this message saves you from having to explicitly add <i>ServiceStateConfig</i> messages for each entity.</p> <p>Taking entities out-of-service prior to configuration is important to prevent system purges caused by configuring a channel that is in-service.</p> <p>Important! Use of <i>AllOutOfService</i> is not recommended for dynamic configurations.</p>
Sent by	SwitchManager
Configuration	<i>AllOutOfService</i> (Node = integer, ConnectionID = integer);

Answer Supervision Mode Configure 0x00BB

SwitchKit Name AnswerSuperviseConfig

Type EXS API and SwitchKit API message

Description **Answer Supervision Mode Configure 0x00BB**

Use this message to configure the Answer Supervision mode for a channel or range of channels.

The Answer Supervision Mode options are:

- Propagate Answer to Distant End
- Notify Host of Answer
- Propagate Answer to Distant End and Notify Host of Answer
- No Answer Supervision - no propagation of answer or notification

CAUTION

Do not send this message for channels configured as the following trunk types:

- DP0
- DPT
- FX0 loopstart and groundstart (OK to use if the answer supervision mode is 0x00 or 0x03)

If you use this message for these trunk types, the CSP sends the response *Status* value “Invalid Data Type” (0x17).

Sent by Host

**Example Message
(SwitchKit Socket Log
Output)**

The following socket log output/example message configures the Answer Supervision Mode to propagate answer to distant end for channels 0x00 - 0x17 on spans 0x01 - 0x02.

```
00 12 00 BB 00 00 FF 01 02 0D 03 00 01 00 0D 03 00 02 17 00
```

SwitchKit Code **Configuration**

```
AnswerSuperviseConfig (  
    Node = integer,  
    Range = StartSpan : StartChan - EndSpan : EndChan,  
    AnswerMode = integer);
```

C Structure

```
typedef struct {
    unsigned short StartSpan;
    UBYTE StartChannel;
    unsigned short EndSpan;
    UBYTE EndChannel;
    UBYTE AnswerMode;
} XL_AnswerSuperviseConfig;
```

C++ Class

```
class XLC_AnswerSuperviseConfig : public
    XLC_ChanRangeMessage {
public:
    unsigned short getStartSpan() const;
    void setStartSpan(unsigned short x);
    UBYTE getStartChannel() const;
    void setStartChannel(UBYTE x);
    unsigned short getEndSpan() const;
};
```

AppConnectionQuery

- Type** SwitchKit API message
- Purpose** Use the *AppConnectionQuery* message to query the Low-Level Communicator (LLC) for description data of a specific application.
- Description** The message is for querying the LLC for description data of a specific application. All of the data is returned in *AppConnectionQueryAck*. In addition to returning the application IDs of connected applications, an acknowledgement will also contain the application IDs of the primary LLC and redundant LLC.
- Sent by** Application
- How to use** To use an *AppConnectionQuery* message construct the message and set the application ID:

```
SKC_AppConnectionQuery acq;
acq.setAppID(app_id);
```
- Arguments** The following table shows the user modifiable argument:

Argument	Description
AppID	Specifies the name of the specific application.

- Status Field** The following table shows the possible return values of the status field:

Value	Description
OK	Query successfully acknowledged
SK_NO_ACK_FROM_SWITCH	CSP did not respond.
SK_UNKNOWN_APP	You used an unknown AppID. This indicates that no application with the specified ID is connected to the LLC.
SK_NO_APP_DATA	Indicates that the application has no description data associated with it.

C Structure	<pre>typedef struct { int AppID; } <i>SK_AppConnectionQuery</i>;</pre>
C Structure Response	<pre>typedef struct { int Status; int AppID; char AppName[80]; char AppVersion[16]; int PID; char Hostname[32]; char StartTime[32]; char SkVersion[16]; char UserData[50]; } <i>SK_AppConnectionQueryAck</i>;</pre>
C++ Class	<pre>class <i>SKC_AppConnectionQuery</i> : public SKC_ToolkitMessage { public: int getAppID() const; void setAppID(int x); };</pre>
C++ Class Response	<pre>class <i>SKC_AppConnectionQueryAck</i> : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); int getAppID() const; void setAppID(int x); const char *getAppName() const; void setAppName(const char *x); const char *getAppVersion() const; void setAppVersion(const char *x); int getPID() const; void setPID(int x); const char *getHostname() const; void setHostname(const char *x); const char *getStartTime() const; void setStartTime(const char *x); const char *getSkVersion() const; void setSkVersion(const char *x); const char *getUserData() const; void setUserData(const char *x); };</pre>

AppDescriptionData

Type	SwitchKit API message
Description	<p>The message <i>AppDescriptionData</i> is used by the function <i>sk_appDescriptionData()</i> that provides additional information to help uniquely identify the application.</p> <p>This message does not have a response acknowledgment.</p>
Sent by	Function <code>sk_appDescriptionData()</code>
C Structure	<pre>typedef struct { } SK_AppDescriptionData;</pre>
C++ Class	<pre>class SKC_AppDescriptionData : public SKC_AdminMessage { public: };</pre>

AppPopulationQuery

Type	SwitchKit API message
Purpose	Use the <i>SK_AppPopulationQuery</i> to query the application IDs of all applications connected to the Low-Level Communicator (LLC).
Description	The <i>AppPopulationQuery</i> message requires no arguments. The message is used for querying the application IDs of all applications connected to the LLC. All IDs are returned in the <i>AppPopulationQueryAck</i> message.
Sent by	Application
How to use	To use an <i>AppPopulationQuery</i> , construct the message with no argument: <pre>SKC_AppPopulationQuery apq;</pre>
Status Field	The following table shows the possible return values of the status field:

Value	Description
OK	Query successful acknowledged.
SK_NO_ACK_FROM_SWITCH	The CSP did not respond.

C Structure	<pre>typedef struct { } <i>SK_AppPopulationQuery</i>;</pre>
C Structure Response	<pre>typedef struct { int Status; int NumApps; int AppIDs[50]; } <i>SK_AppPopulationQueryAck</i>;</pre>
C++ Class	<pre>class <i>SKC_AppPopulationQuery</i> : public SKC_ToolkitMessage { public: };</pre>

C++ Class Response

```
class SKC_AppPopulationQueryAck : public SKC_ToolkitAck
{
public:
    int getStatus() const;
    void setStatus(int x);
    int getNumApps() const;
    void setNumApps(int x);
    const int *getAppIDs() const;
    void setAppIDs(const int *x);
};
```

ARP Cache Query 0x00FC

SwitchKit Name ARPCacheQuery

Type EXS API and SwitchKit API message

Description: **ARP Cache Query 0x00FC**

Use this message to query or flush the entries in a module's ARP cache. If a query is sent, the CSP returns the data in an *ARP Cache Report* message. You can query a specific module by using the ARP query TLV. If the amount of data returned exceeds the 512 byte maximum limit of a host message, the CSP sends multiple messages. To remove entries, use the ARP Remove TLV. You can remove multiple entries by including multiple TLVs. The CSP returns a Status of Positive Acknowledgment (0x000A) upon removal.

NOTE: Entries are automatically flushed from the table if not accessed within five minutes after the connection is torn down.

Sent by: Host

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE AddrInfo[30];
    UBYTE TLVDataType;
    UBYTE TLVCount;
    UBYTE TLVData[221];
} XL_ARPCacheQuery;
```

C++ Class

```
class XLC_ARPCacheQuery : public XLC_OutboundMessage {
public:
    virtual int getTag() const;
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    // Extended addressing functions
    // Slot AIB functions

ARP Cache Report 0x00FB

SwitchKit Name ARPCacheReport

Type EXS API and SwitchKit API message

Description: **ARP Cache Report 0x00FB**

This message is sent by the CSP in response to an *ARP Cache Query* message. The report includes the IP address and Ethernet address for each entry queried. If the ARP cache size is larger than 512 bytes, multiple messages are sent.

SwitchKit Users

If you want to get this report, you must register for it by calling the `sk_msgRegister` function with the parameter, `SK_ARP_CACHE_REPORT`.

Sent by: CSP

Resent in EXS API: This message is resent once after five seconds.

	Checksum		:

0x11 Logical Span AIB for De-Assigning Spans

To de-assign a physical span, logical span, or all spans, use the field values as shown in the table below in the *Assign Logical Span ID* message (0x00A8).

Byte	AIB Field Description			
0	Address Method: 0x00			
1	Number of AEs: 0x01			
2	Address Element: 0x11			
3	Data Length: 0x04			
		All Spans	Physical Span ID	Logical Span ID
4	Data[0] Logical Span ID, MSB	0xFF	0xFF	Valid Logical Span
5	Data[1] Logical Span ID, LSB	0xFF	0xFF	Valid Logical Span
6	Data[2] Slot	0xFF	Valid Physical Slot	0xFF
7	Data[3] Physical Span	0xFF	Valid Span Offset	0xFF

NOTES:

1. De-assigning a Logical Span ID takes the span, and all channels on the span, out of service.
2. De-assigning a span resets its configuration to the default values. When you want to re-initialize a card's configuration (for example, when you restart a host application) use the *Reset Configuration* message.
3. When you de-assign a span, you do **not** receive a *DSO Status Change* message with a *Channel Status* field value 0x01 (Out of Service) for every channel on the span. Assume that all channels on a de-assigned span are out of service.
4. De-assigning all spans will clean up all virtual slots which acts as if the virtual cards were removed.

Associate Chan Group

Type	SwitchKit API message
Description	<p>Use the <i>SK_AssociateChanGroup</i> message to associate a ChannelGroup with specified channels. <i>SK_AssociateChanGroup</i> commands are cumulative. To build a non-contiguous channel group, issue multiple commands. Furthermore, as long as the Low-Level Communicator (LLC) is running, the channel groups are in force. It is recommended that in your configuration files, you have a <i>SK_ClearChanGroup</i> for all the channel groups you intend to use.</p> <p>Important! In channel management, if an application specifies a channel group that was not configured in LLC using an <i>AssociateChannelGroup</i>, the LLC will create that group and assign no channels to that channel group. When <i>AssociateChannelGroup</i> is sent to the LLC, LLC will add the specified channels to that group.</p> <p>If sent by SwitchManager, and <i>SK_AssociateChanGroup</i> includes any signaling channels (D Channel, Link or R2 signaling channel), SwitchManager will exclude those channels from that group.</p> <p>In case an application is responsible for building the groups of channels, the application must call the function <i>sk_associateChannelGroup()</i>. That function then uses the message to create the specified groups.</p>
Sent by	SwitchManager or Application
Configuration	<pre><i>AssociateChanGroup</i>(ChannelGroup = quoted string, range = startSpan:startChannel - endSpan:endChannel);</pre>
C Structure	<pre>typedef struct { unsigned short StartSpan; unsigned short EndSpan; UBYTE StartChannel; UBYTE EndChannel; char ChannelGroup[45]; } SK_AssociateChanGroup;</pre>
C++ Class	<pre>class SKC_AssociateChanGroup : public SKC_AdminMessage { public: unsigned short getStartSpan() const;</pre>

```
void setStartSpan(unsigned short x);
unsigned short getEndSpan() const;
void setEndSpan(unsigned short x);
UBYTE getStartChannel() const;
void setStartChannel(UBYTE x);
UBYTE getEndChannel() const;
void setEndChannel(UBYTE x);
const char *getChannelGroup() const;
void setChannelGroup(const char *x);
};
```

Example The following is an example of AssociateChanGroup for Group Name “all”, with a range of span 0/channel 0 - span 2/channel 23.

```
AssociateChanGroup(
    groupname = "all",
    range = 0:0-2:23);
```

If span 0/channel 23 were a D Channel, SwitchManager would split the message as follows:

```
AssociateChanGroup(
    groupname = "all",
    range = 0:0-0:22);
```

```
AssociateChanGroup(
    groupname = "all",
    range = 1:0-2:23);
```

B Channel Configure 0x00C8

SwitchKit Name BChannelConfig

Type EXS API and SwitchKit API message

Description **B Channel Configure 0x00C8**

Use this message to configure the following information contained in ISDN PRI messages associated with outgoing B channel calls:

- Network Type (network-specific facilities)
- Outgoing Information Transfer Capability
- Calling Number Type
- Calling Number Plan ID
- Calling Presence Indicator
- Calling Screening Indicated
- Called Number Type
- Called Number Plan ID
- Outgoing Response Enable Values

B Channel Query 0x00CA

SwitchKit Name BChannelQuery

Type EXS API and SwitchKit API message

Description **B Channel Query 0x00CA**

Use this message to query the configuration and current channel state information on an ISDN PRI B Channel, DASS2, or DPNSS B Channel. The information in the response varies for ISDN and DASS2/DPNSS.

Related API Messages *B Channel Configure 0x00C8* (SwitchKit Name: BChannelConfig)

Sent by Host

Become Active 0x00A1

SwitchKit Name ActivateMatrix

Type EXS API and SwitchKit API message

Description **Become Active 0x00A1**

For EXS API

Use this message to initiate a switchover in an CSP with a redundant CSP Matrix Series 3 Card or SS7 card. You must send this message to the standby CSP Matrix Series 3 Card from the matrix host or send this message to the standby SS7 card from the SS7 local host. If you send this message to the active CSP Matrix Series 3 Card or active SS7 card, it has no effect on the CSP.

Dialogic recommends sending this message from the Matrix host to initiate a switchover to the standby CSP Matrix Series 3 Card or sending this message from the SS7 local host to initiate a switchover to the standby SS7 card.

For SwitchKit API

ActivateMatrix() initiates a Matrix switchover regardless of what parameters are passed in. With EXS SwitchKit you must send a function call to **sk_activateExnetMatrix()**. You cannot send the message directly to the standby CSP Matrix Series 3 Card.

EXS SwitchKit API does not support sending this message from the host to the standby SS7 card.

BroadcastLoad

Type	EXS SwitchKit API message
Purpose	Do not use this message. This is an internal message used by the function call <i>sk_broadcastLoad()</i> , refer to the <i>EXS SwitchKit Programmer's Guide</i> for information on the <i>sk_broadcastLoad()</i> function.
Description	The Low-Level Communicator (LLC) uses the load value to determine how to distribute the load across several applications that are load sharing.
Sent by	Function <i>sk_broadcastLoad()</i>

Busy Out 0x0018

SwitchKit Name BusyOut

Type EXS API and SwitchKit API message

Description **Busy Out 0x0018**

Use this message to “busy out” a channel or range of channels. This allows the host to control the incoming call rate by busying out a selected group of channels, normally on the front end of a system.

You can busy out channels configured with the following trunk types only:

- E&M
- FXO Loop Start
- FXO Ground Start

Related API Messages *Busy Out Flag Configure* 0x00D3 (SwitchKit Name: BusyOutFlagConfig)

Busy Out Flag Configure 0x00D3

SwitchKit Name BusyOutFlagConfig

Type EXS API and SwitchKit API message

Description **Busy Out Flag Configure 0x00D3**

Use this message to enable the busy out feature on a channel or range of channels.

You cannot “busy out” a channel with the *Busy Out* message if the *Flag* field in this message is disabled (0x00). Only channels configured with a trunk type of E&M, FXO Loop Start, or FXO Ground Start can be busied out.

Call Processing Event 0x002E

SwitchKit Name	CallProcessingEvent
Type	EXS API and SwitchKit API message
Description	<p>Call Processing Event 0x002E</p> <p>The CSP uses this message to report a call processing event on a specified channel. The event to be reported is specified by the host in the messages that support the generation of call processing events.</p>
Sent by	CSP
Resent in EXS API	This message is resent once after five seconds.

SwitchKit Code C Structure

```
typedef struct {
    UBYTE AddrInfo[30];
    unsigned short Span;
    UBYTE Channel;
    UBYTE Event;
    UBYTE Data[222];
} XL_CallProcessingEvent;
```

C++ Class

```
class XLC_CallProcessingEvent : public
    XLC_OneChannelMessage {
public:
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    XBYTE getConferenceID() const;
    void setConferenceID(XBYTE x);
    XBYTE getParentConferenceID() const;
    void setParentConferenceID(XBYTE x);
    XBYTE getChildConferenceID() const;
    void setChildConferenceID(XBYTE x);
    XBYTE getSpan() const;
    void setSpan(XBYTE x);
    UBYTE getChannel() const;
    void setChannel(UBYTE x);
    UBYTE getEvent() const;
    void setEvent(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

Overview of message The following table provides an overview of this message. The table following it, provides the detail for each byte.

MESSAGE		RESPONSE	
Byte	Field Description	Byte	Field Description

Call Processing Event 0x002E

	<p>0x48 Tone Detect Falling Edge (PVD/AMD)</p> <p>0x49 Echo Cancellor Event (when a G.164 tone disabling event occurs on the near or far end)</p> <p>0x50 DSP Series 2 FSK Events</p> <p>0xffff</p> <p>*Event includes no data for Data fields</p>
:	<p>Data</p> <p>These fields provide the specific information for each Event. The length and contents of the information depend on the Event. Some events contain no data.</p> <p>Valid entries for this field are listed below by <i>Call Processing Event</i> field value.</p> <p>0x02 Digits</p> <p> Data[0] Number of Stages Reported</p> <p> Data[1] Impulsed Stage Number</p> <p> Data[2] Impulsed Stage Status</p> <p> Data[3] Stage String Count</p> <p> Data[4] String 1: Digit Count</p> <p> Data[5] String 1: First BCD Encoded Digit Pair</p> <p> :</p> <p> Data[n] String 1: Last BCD Encoded Digit Pair</p> <p> Data[n+1] String 2: First BCD Encoded Digit Pair</p> <p> :</p> <p> Data[m] String 2: Last BCD Encoded Digit Pair</p> <p> Data[4–n] are repeated for each string reported.</p> <p> Data[1–n] are repeated for each stage reported.</p> <p>Stage Status</p> <p>The system reports the stage status for each of the four stages. Timers can be configured.</p> <p>Valid entries for this field are as follows:</p> <p>0x10 Positive Acknowledgment - Digits received</p> <p>0x80 Partial Dial Condition - Receive Inter-digit Duration timer expired</p> <p>0x81 Permanent Signal Condition - Receive 1st Digit Detection timer expired</p> <p>0x91 Impulse Stage Not Collected - Stage not collected; no further stage information will be reported.</p> <p>0x92 Digit Complete Timeout</p> <p>0x97 Positive Acknowledgment - Pulse Digits received</p> <p>If the <i>Call Processing Event</i> message is in response to a <i>DSP Service Request</i> or <i>Collect Digit String</i> message, the Impulsed Stage Number is 0xFF. When the digits are collected using a KP_ST framed digit string collection method, the KP_ST digits are not contained in the reported string.</p> <p>0x0D Backward R2 Signal</p> <p> Data[0] R2 Signal Value (0x01–0x0F)</p> <p>0x0E First Digit Report</p> <p> Data[0] DTMF/MFR1 Digit Value (0x00–0x0F)</p>

Call Processing Event 0x002E

0x0F	PPL Event
Data[0]	PPL Event Number (0x00–0xFF)
0x10	Digit with Timing Information. An asterisk (*) denotes a byte that is always set to “1”
Data[0]	Number of Stages Reported *
Data[1]	Impulsed Stage Number
Data[2]	Impulsed Stage Status
Data[3]	Stage String Count *
Data[4]	Digit Count *
Data[5]	BCD-encoded Digit
Data[6, 7]	Digit Duration (in 10 ms units)

The Impulsed Stage Number will be 0xFF if the *Call Processing Event* message is in response to a *DSP Service Request* or *Collect Digit String* message. The maximum time detected for digit duration is 26.35 seconds. When actual digit duration is greater than 26.35 seconds, it reports as 26.35 (0x0A4B) seconds. Only a *DSP Service Request* message request can result in the Call Processing Event of "Digit With Timing Information" being returned by the CSP.

- 0x25 Recorded Announcement Started
 - Data[0,1] ID of announcement being played (MSB, LSB)

- 0x26 Recorded Announcement Completed
 - Data[0,1] ID of announcement completed (MSB, LSB)

- 0x28 Energy Result Report
 - Data[0] Energy Result Flag
 - 0x00 No Energy Detected
 - 0x01 Energy Detected
 - Data[1,2] Duration of previous Energy Result in 10 ms units

- 0x2A Coin Tone Detection Report
 - Data[0,1] Value of coin detected, in cents
 - 0x0005 5 cents (Nickel)
 - 0x000A 10 cents (Dime)
 - 0x0019 25 cents (Quarter)
 - 0x0064 100 cents (Dollar)

- 0x2B Play File Started
 - Data[0-3] File ID (MSB, ... , ... , LSB)

0x33	Play File Queue Failure Data[0-3] File ID (MSB, ... , ... , LSB) Data[4-7] Offset (starting byte) Data[8-9] Server ID
0x34	Play File Stopped Data[0-3] File ID (MSB, ... , ... , LSB) Data[4-5] Stop Reason 0x0000 - Channel Released 0x0001 - Host Initiated Stop 0x0004 - Out of Chip Cache Space 0x0005 - Digit Detected Data[6-9] Duration of Play (seconds) Data[10-11] Server ID
0x35	Record File Stopped Data[0-3] File ID (MSB, ... , ... , LSB) Data[4-5] Stop Reason 0x0000 - Channel Released 0x0001 - Host Initiated Stop 0x0002 - Out of File Space 0x0003 - NFS Write Error 0x0004 - Out of Chip Cache Space 0x0005 - Digit Detected Data[6-9] Duration of Record (seconds) Data[10-11] Server ID - For cached files, the Server ID is not applicable. In those cases, the Server ID is 0xFFFF.
0x36	DSP Resource Inconsistency Data[0-3] File ID (MSB, ... , ... , LSB)
0x41	DSP Series 2 Fax Processing Events Data[0, 1] Fax processing event code (see below) Data[2, n] Fax processing event data For Data[0, 1] Fax processing event code, above: <u>Phase A, B, C, D, or E:</u> 0x09 Got CRC error in V.21 frame 0x0F Transmit V21 complete 0x1D ERR frame received 0x35 HS modem detected V21. Switch to receive V21 0x39 Unknown V21 frame received with correct CRC 0x3C CRP frame received 0x12D STAT_PHASE_A 0x12E STAT_PHASE_B 0x12F STAT_PHASE_C 0x130 STAT_PHASE_D 0x131 STAT_PHASE_E

Phase A - Call Establishment

Set Event Bit 0x01

0x3E Request the operator line

Phase B - Pre-Message Procedure

Note: Phase B consists of two sections: Identification and Command

Set Event Bit 0x02

0x06 DCS frame received
0x07 DIS frame received
0x08 DTC frame received
0x0C Switch to ECM mode
0x11 CFR frame received
0x12 CTC frame received
0x1E FTT frame received
0x2F Remote machine can receive detected
0x30 Remote machine can transmit detected
0x36 Receive training ended successfully
0x37 Receive training ended in failure
0x38 Transmit training ended
0x3D CTR frame received
0x42 Switch from ECM mode to Normal mode
0x43 Change mode after EOM

Phase C

Note: Phase C consists of two sections: Phase C1, In-Message Procedure and Phase C2, Message Transmission

Set Event Bit 0x04

0x00 Command to start receiving
0x01 Command to start transmitting
0x15 EOR frame received
0x16 EOR_EOM frame received
0x17 EOR_EOP frame received
0x18 EOR_MPS frame received
0x19 EOR_NULL frame received
0x1A EOR_PRI_EOM frame received
0x1B EOR_PRI_EOP frame received
0x1C EOR_PRI_MPS frame received
0x3A Start of image receive
0x40 ECM frames where detected in error
0x47 End of image transmit
0x48 Start of image transmit
0x4A Receive image operation complete
0x4C Go to point D in the T.30 flow chart
0x4D Got the 4th PPR
0x4E Decided to continue to correct after 4th PPR

Phase D - Post Message Procedure

Set Event Bit 0x08

0x13	EOM frame received
0x14	EOP frame received
0x20	MCF frame received
0x21	MPS frame received
0x22	PIN frame received
0x23	PIP frame received
0x24	PPR frame received
0x25	PPS_EOM frame received
0x26	PPS_EOP frame received
0x27	PPS_MPS frame received
0x28	PPS_NULL frame received
0x29	PPR_PRI_EOM frame received
0x2A	PPS_PRI_EOP frame received
0x2B	PPS_PRI_MPS frame received
0x2C	PRI_EOM frame received
0x2D	PRI_EOP frame received
0x2E	PRI_MPS frame received
0x31	RNR frame received
0x32	RR frame received
0x33	RTN frame received
0x34	RTP frame received
0x41	Receiver is not ready to continue
0x44	Got end of a page
0x45	Last document in the queue was processed

Phase E - Call Release

Set Event Bit 0x10

0x05	DCN frame received
0x0A	Go to B point in T.30 flow chart
0x1F	Transition to C-point on T.30 flow charts
0x65	FAX Protocol Complete only for Send FAX
0xFFF0	FAX I/O Complete for RCV FAX and Send FAX
0xFE	FAX Failed

Timer Event

Set Event Bit 0x20

0x03	Hardware failure timer expired
0x0D	T1 timer expired
0x0E	T4 timer expired
0x3B	T2 timer expired (see T.30)
0x4B	T3 timer expired
0x4F	T5 timer expired

Data Pump

Set Event Bit 0x40

0x02	T.30 is ready to receive
0x04	T.30 is ready to transmit
0x10	Hardware close completed
0x51	V.21 receiver has started to send preamble
0x52	V.21 receiver has completed operation
0x53	V.21 transmitter has started to send preamble
0x54	V.21 transmitter has completed operation
0x55	High-speed receiver has started to send preamble
0x56	High-speed receiver has received TCF, no errors
0x57	High-speed receiver has received TCF with errors
0x58	High-speed transmitter has started to send TCF
0x59	High-speed transmitter has completed TCF
0x5A	High-speed transmitter has started
0x5B	High-speed transmitter has completed operation
0x5C	High-speed receiver has started to send preamble
0x5D	High-speed receiver has lost carrier
0x5E	V21 Receive Frame
0x5F	V21 Transmit Frame
0x62	V21 signal detected by the HS receiver
0x63	Modem subsystem ready to transmit
0x64	Modem subsystem ready to receive
0x65	Modem subsystem has stopped operations
0x79	Non-Standard facilities (NSF) frame sent or receive
0x7A	Non-Standard facilities Set-up (NSS) frame sent or receive
0x7B	Non-Standard facilities Command (NSC) frame sent or receive
0x7C	Called Subscriber Identification (CSI) frame sent or receive
0x7D	Transmitting Subscriber Identification (TSI) frame sent or receive
0x7E	Calling Subscriber Identification (CIG) frame sent or receive
0x7F	Selective Polling (SEP) frame sent or receive
0x80	Subaddress (SUB) frame sent or receive
0x81	Password (PWD) frame sent or receive
0x82	Digital Identification Signal (DIS) frame sent or received
0x83	Digital Command Signal (DCS) frame sent or receive

Call Processing Event 0x002E

0x84	Digital Transmit Command (DTC) frame sent or receive
0x85	Continue To Correct (CTC) frame sent or receive
0x86	Partial Page Request (PPR) frame sent or received
0x87	Partial Page Signal-NULL(PPS-NULL) frame sent or receive
0x88	Partial Page Signal (PPS)-MPS frame sent or receive
0x89	Partial Page Signal (PPS)-EOM frame sent or receive
0x8A	Partial Page Signal (PPS)-EOP frame sent or receive
0x8B	PRI-PPS-MPS frame sent or receive
0x8C	PRI-PPS-EOM frame sent or receive
0x8D	PRI-PPS-EOP frame sent or receive
0x8E	EOR-NULL frame sent or receive
0x8F	EOR-MPS frame sent or receive
0x90	EOR-EOM frame sent or receive
0x91	EOR-EOP frame sent or receive
0x92	PRI-EOR-MPS frame receive
0x93	PRI-EOR-EOM frame sent or receive
0x94	PRI-EOR-EOP frame sent or receive
0x95	CRC error reported

Call Progress Analysis Class Configure 0x00B3

SwitchKit Name CPAClassConfig

Type EXS API and SwitchKit API message

Description **Call Progress Analysis Class Configure 0x00B3**

Use this message to add a pattern, delete a pattern, or to change the parameters of a pattern in a call progress analysis class.

Sent by Host

Overview of message The following table provides an overview of this message. The table following it, provides the detail for each byte.

Bit 0 Advanced Answer Detect Bit 1 Energy Detection Bits 2–7 Reserved</p> <p>**If Data[0] is 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, or 0x09, Data[1–2] are as follows: Data[1] The time in 10-ms units, MSB Data[2] The time in 10-ms units, LSB</p> <p>***If Data[0] is 0x0A, Data[1–2] are as follows: Data[1] 0x00 Data[2] Number of Frequency Bursts in 500 ms before answer is declared</p>
----------	---

	<p>‡If Data[0] is 0x0B, Data[1–2] are as follows: Data[1] 0x00 (Reserved) Data[2] Sensitivity Level (for more information on Energy Detection mode, refer to the DSP Series 2 Card Product Description in the Developer’s Guide Overview).</p> <p style="margin-left: 40px;">0x00 0 dBm 0x01 5 dBm 0x02 10 dBm 0x03 15 dBm 0x04 20 dBm 0x05 25 dBm 0x06 30 dBm</p> <p>‡If Data[0] is 0x0C, Data[1–2] are as follows: Data[1] Scan Duration in 20-ms increments, MSB Data[2] Scan Duration in 20-ms increments, LSB</p> <p>The value must be expressed in 20 ms increments, using 10 ms units. For example, you should use 0x0002 = 20 ms, 0x0004 = 40 ms, and so on.</p> <p>The CSP rounds down odd values. For example, the system rounds down 0x0003 to = 20ms. For more information on Energy Detection mode, refer to the appropriate Developer’s Guide.</p>
:	Checksum

Example 1 The table that follows shows a message that changes the number of frequency bursts per 500 ms (before declaring answer) to “5.”

MESSAGE		
Byte	Field	Field Value
0	Frame	0xFE
1	Length, MSB	0x00
2	Length, LSB	0x0B
3	Message Type, MSB	0x00
4	Message Type, LSB	0xB3
5	Reserved	0x00
6	Sequence Number	0x01
7	Logical Node ID	0xFF
8	Update All Flag	0x01
9	Class ID	0x00
10	Action	0x03 (Change Class Parameter)
11	Data[0] Parameter	0x0A (Advanced Answer Detect)
12	Data[1] Number of Frequency Bursts, MSB	0x00
13	Data[2] Number of Frequency Bursts, LSB	0x05 (5 bursts per 500 ms)
14	Checksum	0xD1

Example 2 This example shows the message sequence you would use to change the mode of Call Progress Analysis Class 3 to Energy Detection, with a sensitivity level of -30 dBm and a scan duration of 60ms.

To change the mode, you send the following three *Call Progress Analysis Class Configure* messages in this sequence:

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x01 (Mode)
10	Data[1] – Reserved	0x00
11	Data[2] – Mode	0x02 (Energy Detection enabled)

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x0B (Mode Specific 1)
10	Data[1] – Reserved	0x00
11	Data[2] – Sensitivity Level	0x06 (-30 dBm)

Byte	Message Field	Field Value
8	Action	0x03 (Change Class Parameter)
9	Data[0] – Parameter	0x0C (Mode Specific 2)
10	Data[1] – Reserved	0x00
11	Data[2] – Scan Duration	0x06 (60 ms)

Call Progress Analysis Configuration Query 0x008A

SwitchKit Name	CPAConfigQuery
Type	EXS API and SwitchKit API message
Description	Call Progress Analysis Configuration Query 0x008A Use this message to query call progress analysis (CPA) configuration information.
Sent by	Host

SwitchKit Code **C Structure**

```
typedef struct {  
    UBYTE QueryEntity;  
    UBYTE DataType;  
} XL_CPAConfigQuery;
```

C Structure Response

CancelUserTimer

Type:	SwitchKit API message
Description	<p>Use this message to cancel a previously sent <i>UserTimer</i> message or group of <i>UserTimer</i> messages. This will cause the canceled timer to go off with a negative status value, SK_CANCELED. All handler functions which are installed to handle <i>UserTimer</i> expirations should be prepared to do nothing if the Status is not positive. If you want to cancel a <i>UserTimer</i>, the GroupTag should be set when the <i>UserTimer</i> is sent. This GroupTag should be saved for later use.</p> <p>When you want to cancel that timer, you need to send a <i>CancelUserTimer</i> message with the appropriate GroupTag entered. All currently unexpired <i>UserTimer</i> messages from that application with the corresponding GroupTag are canceled, and the acknowledgment sent back will contain the number of timers that were canceled. Depending on how the <i>UserTimer</i> messages are set up, you can cancel a set of <i>UserTimer</i> messages with a single <i>CancelUserTimer</i> message.</p> <p>It is important to realize that the GroupTag domain is unique to each application. This prevents one application from canceling another application's <i>UserTimer</i>. If multiple applications use the same GroupTag in a timer, and one application cancels that tag, only the timers from that application will be canceled. All other timers will still expire normally.</p>
Sent by	Application
Arguments	The following table shows the arguments that you can modify:

Argument	Description
GroupTag	<p>Cancellation of a timer requires that this field be set at creation of the timer and then remembered. When you want to cancel that timer, you need to send a <i>CancelUserTimer</i> message with the appropriate GroupTag entered. All currently unexpired UserTimer messages from that application with the corresponding GroupTag are canceled.</p> <p>It is important to realize that the GroupTag domain is unique to each application. This prevents one application from canceling another application's <i>UserTimer</i>. If multiple applications use the same GroupTag in a timer, and one application cancels that tag, only the timers from that application will be canceled. All other timers will still expire normally.</p>

:	<p>Serial Number MSB, LSB This two-byte field indicates the serial number of the card.</p>
:	<p>RAM Size MSB, LSB This two-byte field indicates the amount of RAM on the card, in 1K increments. For the VDAC VoIP Card and VDAC VoIP Module, RAM is measured in 1 MB increments.</p>
:	<p>Card Information (Field length varies) The card information, including the length of the field, varies per card type. The system uses the value 0x00 for fields that do not apply to the card or for all fields, if there is no card information.</p> <p><u>IP Signaling Series 3 Card</u> No card specific or hardware specific information is sent for this card.</p> <p>T-ONE, E-ONE, J-ONE, DS3, ST1LC, SE1LC, VDAC-ONE, IP Network Interface Series 2/3, and SS7 Multi- Protocol cards. The card information for these cards indicates the logical spans assigned to the card. The logical spans are indicated in the Logical Span AIB (0x0C) as shown below. The CSP uses the value 0xFF to indicate that no span has been assigned. An AIB for a 4-span line card has four address elements and the value 0x00 for the remaining bytes. An AIB for an 8-span line card has eight address elements and the value 0x00 for the remaining bytes.</p> <p style="padding-left: 40px;">Data[0] Address Method (0x00, Single Entity) Data[1] Number of Address Elements (equal to number of spans)</p> <p style="padding-left: 40px;">Address Element 1: Span 0 Data[2] Address Type (0x0C, Logical Span) Data[3] Data Length (0x02) Data[4] Logical Span ID, MSB Data[5] Logical Span ID, LSB</p> <p style="padding-left: 40px;">Address Element N: Span N Data[...] Address Type (0x0C, Logical Span) Data[...] Data Length (0x02) Data[...] Logical Span ID, MSB Data[...] Logical Span ID, LSB</p>

MFDSP and DSP-ONE Cards

The card information for the DSP-ONE cards indicates the function types for DSPs on all SIMMs on the card.

NOTE: For more information on function types, refer to the *DSP SIMM Configure (0xC0)* message.

<u>Byte</u>	<u>Function Type</u>
Data[0]	SIMM 0/DSP 0
Data[1]	SIMM 0/DSP 1
Data[2]	SIMM 0/DSP 2
Data[3]	SIMM 0/DSP 3
Data[4]	SIMM 1/DSP 0
Data[5]	SIMM 1/DSP 1
Data[6]	SIMM 1/DSP 2
Data[7]	SIMM 1/DSP 3
Data[8]	SIMM 2/DSP 0
Data[9]	SIMM 2/DSP 1
Data[10]	SIMM 2/DSP 2
Data[11]	SIMM 2/DSP 3
Data[12]	SIMM 3/DSP 0
Data[13]	SIMM 3/DSP 1
Data[14]	SIMM 3/DSP 2
Data[15]	SIMM 3/DSP 3
Data[16–33]	Reserved

DSP Series 2 and DSP Series 2 Plus Cards

The card information for the DSP Series 2 and DSP Series 2 Plus cards indicates the function types for all DSPs on all Modules on the card, because each DSP can do multiple configurations.

<u>Byte</u>	<u>Function Type</u>
Data[0]	Module 0 / DSP 0 / RCV 0
Data[1]	Module 0 / DSP 0 / TXMT 0
Data[2]	Module 0 / DSP 0 / RCV 1
Data[3]	Module 0 / DSP 0 / TXMT 1
Data[4]	Module 0 / DSP 1 / RCV 0
Data[5]	Module 0 / DSP 1 / TXMT 0
Data[6]	Module 0 / DSP 1 / RCV 1
Data[7]	Module 0 / DSP 1 / TXMT 1
Data[8]	Module 0 / DSP 2 / RCV 0
Data[9]	Module 0 / DSP 2 / TXMT 0
Data[10]	Module 0 / DSP 2 / RCV 1
Data[11]	Module 0 / DSP 2 / TXMT 1
Data[12]	Module 0 / DSP 3 / RCV 0
Data[13]	Module 0 / DSP 3 / TXMT 0
Data[14]	Module 0 / DSP 3 / RCV 1

ST1LC and SE1LC cards

Data[0] Informs the host of primary and secondary loop timing clock sources configured on the card.
Bits 0-2 If secondary loop timing is enabled, this field contains the offset of the span for which it is enabled.
Bit 3 Secondary Loop timing
0 Disabled
1 Enabled
Bit 4-6 If primary loop timing is enabled, this field contains the offset of the span for which it is enabled.
Bit 7 Primary Loop timing
0 Disabled
1 Enabled
Data[1-15] Reserved

T-ONE, E-ONE, J-ONE cards

Data 0-3 Informs the host of primary and secondary loop timing clock sources configured on the card

Data[0] Primary Loop Timing
0 Not Enabled
1 Enabled
Data[1] If Primary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.
Data[2] Secondary Loop Timing
0 Not enabled
1 Enabled
Data[3] If Secondary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.
Data[4-13] Reserved
Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1)
Data[15] Total Available Spans

MFDSP and DSP-ONE Card

This field informs the host of the number and types of DSP SIMMs installed on the card.

Data[0] Number of DSP SIMMs installed on the card

Data[1] Reserved

Data[2] SIMM 0 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[3] SIMM 1 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[4] SIMM 2 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data[5] SIMM 3 Type

0x00 C31 SIMM

0x01 VRA SIMM

0x03 No SIMM installed

Data 6-9: SIMM State 0 - SIMM State 3

0x00 In Service

0x01 Out of Service (or No SIMM Installed)

Data[6] SIMM 0 State

Data[7] SIMM 1 State

Data[8] SIMM 2 State

Data[9] SIMM 3 State

Data[10-15]Reserved

DSP Series 2 and DSP Series 2 Plus Cards

This field informs the host of the number and types of DSP Modules installed on the card.

- Data[0] Number of Modules installed on the card
- Data[1] Reserved
- Data[2] Module 0 Type
 - 0x6C DSP 2 Module
 - 0x03 No Module installed
- Data[3] Module 1 Type
 - 0x6C DSP 2 Module
 - 0x03 No Module installed
- Data[4, 5] Reserved
- Data 6-13: DSP Chip States
 - 0x00 In Service
 - 0x01 Out of Service (or No Module Installed)
- Data[6] Module 0 / Chip 0 State
- Data[7] Module 0 / Chip 1 State
- Data[8] Module 0 / Chip 2 State
- Data[9] Module 0 / Chip 3 State
- Data[10] Module 1 / Chip 0 State
- Data[11] Module 1 / Chip 1 State
- Data[12] Module 1 / Chip 2 State
- Data[13] Module 1 / Chip 3 State
- Data[14-15] Reserved

ISDN PRI Card

- Data[0] Munich Chip Count
- Data[1-15] Reserved

EXNET-ONE card

Data[0–3]Informs host of primary and secondary loop timing clock sources configured from ring timing on the card. For EXNET-ONE cards configured as a Single Ring Redundancy Standby, the Loop Timing fields are always disabled.

- Data[0] Primary Loop Timing
 - 0x00 Not Enabled
 - 0x01 Enabled
- Data[1] Reserved
- Data[2] Secondary Loop Timing
 - 0x00 Not Enabled
 - 0x01 Enabled
- Data[3] Reserved

SS7 cards

The system does not report hardware configuration information for these cards. All bytes are 0x00.

SS7 Multi-Protocol I/O card

Data[0] Channel 0 Data Rate
0x00 64 Kbps
0x01 56 Kbps, for non-V.35 applications
0x80 V.35, 56 Kbps
0x81 48 Kbps, for non-V.35 applications
0xC0 V.35, 48 Kbps

Data[1] Channel 0 Electrical Interface
0x00 No Timing
0x01 V.35, DTE
0x02 V.35, DCE

Data[2] Channel 1 Data Rate (same possibilities as Channel 0, above)
Data[3] Channel 1 Electrical Interface (same possibilities as Channel 0, above)
Data[4] Channel 2 Data Rate (same possibilities as Channel 0, above)
Data[5] Channel 2 Electrical Interface (same possibilities as Channel 0, above)
Data[6] Channel 3 Data Rate (same possibilities as Channel 0, above)
Data[7] Channel 3 Electrical Interface (same possibilities as Channel 0, above)

VDAC-ONE card

Data[0] Number of VoIP Modules (1 - 4)
Data[1] Number of channels supported (MSB)
Data[2] Number of channels supported (LSB)
Data[3] Installed VoIP Modules (Bit Field):
 Bit 0 VoIP Module 0 (0 = not installed, 1 = installed)
 Bit 1 VoIP Module 1 (0 = not installed, 1 = installed)
 Bit 2 VoIP Module 2 (0 = not installed, 1 = installed)
 Bit 3 VoIP Module 3 (0 = not installed, 1 = installed)
Data[4] Module 0 state (0x05=ready, other values=not ready)
Data[5] Module 1 state (0x05=ready, other values=not ready)
Data[6] Module 2 state (0x05=ready, other values=not ready)
Data[7] Module 2 state (0x05=ready, other values=not ready)
Data[8] Port Consumption Mode
 1 Reserved
 2 Port-Consuming
Data[9-15] Reserved (should be zero)

VDAC VoIP Module

Data[0] Total number of channels supported on the module
Data[1] Number of channels supported for DSP 0
Data[2] Number of channels supported for DSP 1
Data[3] Number of channels supported for DSP 2
Data[4] Number of channels supported for DSP 3
Data[5] Number of channels supported for DSP 4
Data[6] Number of channels supported for DSP 5
Data[7] Number of channels supported for DSP 6
Data[8] Number of channels supported for DSP 7
Data[9-15]Reserved (should be zero)

IP Network Interface Series 2 card

Data[0] Number of VoIP Modules (0 - 2)
Data[1] Number of channels supported (MSB)
Data[2] Number of channels supported (LSB)
Data[3] Installed VoIP Modules (Bit Field):
 Bit 0 VoIP Module 0 (0 = not installed, 1 = installed)
 Bit 1 VoIP Module 1 (0 = not installed, 1 = installed)
 Bit 2 VoIP Module 2 (0 = not installed, 1 = installed)

Note that for Data 4 - 6 each module can be in one of the following states:
0x02 - Not Present, 0x05 - In Service, 0x06 - Out of Service, and 0x08 - Failed

Data[4] Module 0 State
Data[5] Module 1 State
Data[6] Module 2 State

Note that for Data 7 - 9 each module can be to one of the following IP resource profiles:

0x01 - G.711 Only (16 spans per module)
0x02 - G.711 + G.723.1 + G.729 + T.38 (8 spans per module)
0x0F - Not applicable (For example, module is not present)

Data[7] Module 0 Profile
Data[8] Module 1 Profile
Data[9] Module 2 Profile

Data[10] Port Consumption Mode
 1 = Non Port-Consuming
 2 = Port-Consuming

Data[11-14] Refer to IPN-3 card

Data[15] Reserved (Set to 0)

IP Network Interface Series 2 Card Module

Data[0] Total number of channels supported for the module (MSB)
Data[1] Total number of channels supported for the module (LSB)
Data[2] Module State
Data[3] Module Profile
Data[4] Bitmap of installed DSPs on a VoIP module (1 - Installed)
Data[5] Bitmap of available DSPs on a VoIP module (1 - available)
Data[6] Number of channels per available DSP
Data[7] MII Bridge FPGA Version
Data[8 - 15] Reserved (Set to 0)

IP Network Interface Series 3 Card

Data[0] Number of VoIP Modules (0 - 1)
Data[1] Number of channels supported (MSB)
Data[2] Number of channels supported (LSB)
Data[3] Installed VoIP Modules (Bit Field):

Bit 0 VoIP Module 0 (0 = not installed, 1 = installed)
Bit 1 VoIP Module 1 (0 = not installed, 1 = installed)

Data[4] Module 0 State
Data[5] Module 1 State

Note that for Data 4 - 5 each module can be in one of the following states:

0x02 - Not Present, 0x05 - In Service, 0x06 - Out of Service, and 0x08 - Failed

Data[6] Module 0 Profile
Data[7] Module 1 Profile

Note that for Data 6-7 each module can be to one of the following IP resource profiles:

0x04 - G.711 Only (16 spans per module)
0x05 - LBR + T.38 (8 spans per module)
0x0F - Not applicable (For example, module is not present)

Data[8] Port Consumption Mode
1 = Non Port-Consuming
2 = Port-Consuming

Data[9] Main board dip switch settings (bit mask) (first value is default)
Bit 2-3 Speed
0 0 = 10Mbps
0 1 = 100Mbps
1 0 = 1000Mbps
Bits [4-7] Reserved (should be zero)

Data[10] Port 0 Info (CTRL 0)
Bit 0 Ethernet Link Status
 0 = Ethernet link down
 1 = Ethernet link up
Bit 1 Duplex Type
 0 = Half Duplex
 1 = Full Duplex
Bit 2-3 Speed
 0 0 = 10Mbps
 0 1 = 100Mbps
 1 0 = 1000Mbps

Bits [4-7] Reserved (should be zero)

Data[11] Port 1 Info (CTRL 1)
Bit 0 Ethernet Link Status
 0 = Ethernet link down
 1 = Ethernet link up
Bit 1 Duplex Type
 0 = Half Duplex
 1 = Full Duplex

Data[12] Port 2 Info (DATA 0)
Bit 0 Ethernet Link Status
 0 = Ethernet link down
 1 = Ethernet link up
Bit 1 Duplex Type
 0 = Half Duplex
 1 = Full Duplex
Bit 2-3 Speed
 0 0 = 10Mbps
 0 1 = 100Mbps
 1 0 = 1000Mbps
Bits [4-7] Reserved (should be zero)

Data[13] Port 3 Info (DATA 1)
Bit 0 Ethernet Link Status
 0 = Ethernet link down
 1 = Ethernet link up
Bit 1 Duplex Type
 0 = Half Duplex
 1 = Full Duplex
Bit 2-3 Speed
 0 0 = 10Mbps
 0 1 = 100Mbps
 1 0 = 1000Mbps

Card Status Report 0x00A6

SwitchKit Name	CardStatusReport
Type	EXS API and SwitchKit API message
Description	<p>Card Status Report 0x00A6</p> <p>This message reports information about a card's status. Because this message is defined differently for different card types, some fields listed below may not apply.</p> <p>This message is sent to the host when the host sends the <i>Card Status Query</i> message or when a card is reset.</p>
Sent by	CSP
Resent in EXS API	This message is resent once after five (5) seconds.
Example Message for EXS API	<p>The following example shows a trace of a <i>Card Status Report</i> message for a 4-span ST1LC card.</p> <p>Header (bytes 0-9):</p> <pre>fe [00 51] [00 a6] 00 06 ff [00 00]</pre> <p>AIB (bytes 10-14):</p> <pre>00 01 01 01 01</pre> <p>Misc. An AIB for an 8-span line card has eight address elements and the value 0x00 for the remaining bytes.</p> <p>Data[0] Address Method (0x00, Single Entity) Data[1] Number of Address Elements (equal to number of spans)</p> <p>Address Element 1: Span 0 Data[2] Address Type (0x0C, Logical Span) Data[3] Data Length (0x02) Data[4] Logical Span ID, MSB Data[5] Logical Span ID, LSB</p> <p>Address Element N: Span N Data[...] Address Type (0x0C, Logical Span) Data[...] Data Length (0x02) Data[...] Logical Span ID, MSB Data[...] Logical Span ID, LSB</p>

DSP Series 2 and DSP Series 2 Plus Cards

The card information for the DSP Series 2 and DSP Series 2 Plus cards indicates the function types for all DSPs on all Modules on the card, because each DSP can do multiple configurations.

<u>Byte</u>	<u>Function Type</u>
Data[0]	Module 0 / DSP 0 / RCV 0
Data[1]	Module 0 / DSP 0 / TXMT 0
Data[2]	Module 0 / DSP 0 / RCV 1
Data[3]	Module 0 / DSP 0 / TXMT 1
Data[4]	Module 0 / DSP 1 / RCV 0
Data[5]	Module 0 / DSP 1 / TXMT 0
Data[6]	Module 0 / DSP 1 / RCV 1
Data[7]	Module 0 / DSP 1 / TXMT 1
Data[8]	Module 0 / DSP 2 / RCV 0
Data[9]	Module 0 / DSP 2 / TXMT 0
Data[10]	Module 0 / DSP 2 / RCV 1
Data[11]	Module 0 / DSP 2 / TXMT 1
Data[12]	Module 0 / DSP 3 / RCV 0
Data[13]	Module 0 / DSP 3 / TXMT 0
Data[14]	Module 0 / DSP 3 / RCV 1
Data[15]	Module 0 / DSP 3 / TXMT 1
Data[16]	Module 1 / DSP 0 / RCV 0
Data[17]	Module 1 / DSP 0 / TXMT 0
Data[18]	Module 1 / DSP 0 / RCV 1
Data[19]	Module 1 / DSP 0 / TXMT 1
Data[20]	Module 1 / DSP 1 / RCV 0
Data[21]	Module 1 / DSP 1 / TXMT 0
Data[22]	Module 1 / DSP 1 / RCV 1
Data[23]	Module 1 / DSP 1 / TXMT 1
Data[24]	Module 1 / DSP 2 / RCV 0

Data[30]	Module 1 / DSP 3 / RCV 1
Data[31]	Module 1 / DSP 3 / TXMT 1
Data[32]	Reserved
Data[33]	Reserved

EXNET-ONE

This card generates no special information for this field. All bytes are 0x00.

SS7 Card

Data[0] Maximum Configurable Links for card
Data[1] Slot Number of Active SS7 Card (see Note)
Data[2] Slot Number of Secondary SS7 Card in Redundant Pair (see Note)
Data[3] Stack ID
Data[4] Stack ID
Data[5] Stack ID
Data[6] Stack ID
Data[7–15]Reserved

NOTE: Do not try to determine the redundancy status from bytes Data[1] and Data[2].
To determine the redundancy status, use the *CCS Redundancy Query* message.

Redundant I/O and Standby I/O

A Slot AIB indicates the slot number of the other I/O (Standby I/O or Redundant I/O)
involved in a switchover.

SS7 Multi-Protocol I/O Card

0x0C Logical Span AIB

PCI H.100 Card

The card information fields depend upon on H.100 bus clock speed and the number of spans per
channel.

4MHz and 24 channels per span display 21 span entries
4MHz and 32 channels per span display 16 span entries
8MHz and 24 channels per span display 80 span entries
8MHz and 32 channels per span display 64 span entries

:	<p>Hardware Configuration (16 bytes) This 16-byte field describes the hardware configuration of the card specified. This field applies to only the cards described below. It also describes DIP switch positions on the cards indicated.</p> <p><u>DS3 cards</u></p> <p>Data[0] Number of Spans Supported: 0x18 24 Spans 0x1C 28 Spans</p> <p>Data[1] DS3 Offset Framer Status Bit 0 - DS3 Offset 0 Framer Status 0 - Out of Service 1 - In Service (default) Bit [1-7] Reserved</p> <p>Data [2-13] Reserved</p> <p>Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1)</p> <p>Data[15] Total Available Spans</p> <p><u>ST1LC and SE1LC cards</u></p> <p>Data[0] Informs the host of primary and secondary loop timing clock sources configured on the card. Bits 0-2 If secondary loop timing is enabled, this field contains the offset of the span for which it is enabled. Bit 7 Primary Loop timing 0 Disabled 1 Enabled</p> <p>Data[1-15] Reserved</p>
---	---

T-ONE, E-ONE, J-ONE cards

Data 0–3 informs the host of primary and secondary loop timing clock sources configured on the card

Data[0] Primary Loop Timing

0 Not Enabled

1 Enabled

Data[1] If Primary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.

Data[2] Secondary Loop Timing

0 Not enabled

1 Enabled

Data[3] If Secondary Loop Timing is enabled, this field contains the span offset of the span for which it is enabled.

Data[4–13] Reserved

Data[14] Hardware Switch 1 Settings (also refer to the Hardware Product Descriptions) (the right-most bit is dip 1)

Data[15] Total Available Spans

DSP Series 2 and DSP Series 2 Plus Cards

This field informs the host of the number and types of DSP Modules installed on the card.

- Data[0] Number of Modules installed on the card
- Data[1] Reserved
- Data[2] Module 0 Type
 - 0x6C DSP 2 Module
 - 0x03 No Module installed
- Data[3] Module 1 Type
 - 0x6C DSP 2 Module
 - 0x03 No Module installed
- Data[4, 5] Reserved
- Data 6-13: DSP Chip States
 - 0x00 In Service
 - 0x01 Out of Service (or No Module Installed)
- Data[6] Module 0 / Chip 0 State
- Data[7] Module 0 / Chip 1 State
- Data[8] Module 0 / Chip 2 State
- Data[9] Module 0 / Chip 3 State
- Data[10] Module 1 / Chip 0 State
- Data[11] Module 1 / Chip 1 State
- Data[12] Module 1 / Chip 2 State
- Data[13] Module 1 / Chip 3 State
- Data[14] Main Board DIP Switch S1Settings (Bit Field)
 - Bit 0 Debug 1 Mode (ON=Disabled; OFF= Enabled)
 - Bit 1 Reserved (ON)
 - Bit 2 Debug 2 Mode (ON=Disabled; OFF= Enabled)
 - Bit 3 Ethernet Link Mode (ON=Auto-Negotiate; OFF= Force 100 Mbps/
Full Duplex)
 - Bit 4 Reserved (ON)
 - Bit 5 Reserved (ON)
 - Bit 6 Reserved (ON)
 - Bit 7 Reserved (ON)
 - Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position 1
- Bit 7 to Position 8)
 - Note: Default setttings are ON position
- Data[15] Reserved

CSP Matrix Series 3 Card

- Data[0] Main Board DIP Switch S1Settings (Bit Field)
- Bit 0 Print to Terminal (ON=Disabled; OFF= Enabled)
 - Bit 1 Reserved (ON)
 - Bit 2 System Software/Probe (ON=Enables System Software; OFF Enables Probe)
 - Bit 3 CSP Call Control/Services (ON=Call Control Call Processing Enabled; OFF=Services Call processing Enabled)
 - Bit 4 Reserved (ON)
 - Bit 5 Reserved (ON); OFF=API
 - Bit 6 Using Second Ethernet Port (ON=At startup, Ethernet Port 1 (ETH1) is only used; OFF=At startup, both Ethernet Ports (ETH1 and ETH2) can be used.
 - Bit 7 No Static IP Address (ON=If RARP and BOOTP can not obtain an IP address, the static IP address is used; OFF=If RARP and BOOTP can not obtain an IP address, the static IP address is **not** used)
- Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position - Bit 7 to Position 8)
- Note: Default settlings are ON position, except Bit 5 which is OFF
- Data[1] Main Board DIP Switch S2Settings (Bit Field)
- Bit 0 Ethernet Link Mode (ON= Force 100 Mbps/Full Duplex; OFF=Auto-Negotiate)
 - Bit 1 Reserved (OFF)
 - Bit 2 Reserved (OFF)
 - Bit 3 Reserved (OFF)
 - Bit 4 Reserved (OFF)
 - Bit 5 Reserved (OFF)
 - Bit 6 Reserved (OFF)
 - Bit 7 Reserved (OFF)
- Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position 1 - Bit 7 to Position 8)
- Note: Default settlings are OFF position

IP Signaling Series 3 Card

- Data[0] Main Board DIP Switch SW1Settings (Bit Field)
- Bit 0 Debug 1 Mode (ON=Disabled; OFF= Enabled)
 - Bit 1 Monitor Port (ON= Monitor Port setting is 19200 baud and is and not selectable; OFF=Reserved)
 - Bit 2 Debug 2 Mode (ON=Disabled; OFF= Enabled)
 - Bit 3 Ethernet Link Mode (ON=Auto-Negotiate; OFF= Force 100 Mbps/ Full Duplex)
 - Bit 4 Layer 5 (ON=Disabled; OFF= Enabled)
 - Bit 5 Reserved (ON); API
 - Bit 6 Reserved (ON)
 - Bit 7 No Static IP Address (ON=If RARP and BOOTP can not obtain an IP address, the static IP address is used; OFF=If RARP and BOOTP can not obtain an IP address, the static IP address is **not** used)
- Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position 1 - Bit 7 to Position 8)
- Note: Default settlings are ON position, except Bit 5 which is OFF

SS7 Series 3 Card

Data[0] Main Board DIP Switch SW1Settings (Bit Field)
Bit 0 Debug 1 Mode (ON=Disabled; OFF= Enabled)
Bit 1 Monitor Port (ON/OFF= Monitor Port setting is 19200 baud)
Bit 2 Debug 2 Mode (ON=Disabled; OFF= Enabled)
Bit 3 Reserved (ON)
Bit 4 Reserved (ON)
Bit 5 Reserved (ON)
Bit 6 Reserved (ON)
Bit 7 Reserved (ON)
Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position 1
- Bit 7 to Position 8
Note: Default setttings are ON position

ISDN Series 3 Card

Data[0] Main Board DIP Switch SW1Settings (Bit Field)
Bit 0 Debug 1 Mode (ON=Disabled; OFF= Enabled)
Bit 1 Monitor Port (ON/OFF= Monitor Port setting is 19200 baud)
Bit 2 Debug 2 Mode (ON=Disabled; OFF= Enabled)
Bit 3 Reserved (ON)
Bit 4 Reserved (ON)
Bit 5 Reserved (ON)
Bit 6 Reserved (ON)
Bit 7 Reserved (ON)
Note: Each Bit maps to the physical DIP switch positions (Bit 0 to Position 1
- Bit 7 to Position 8
Note: Default setttings are ON position

EXNET-ONE card

Data[0-3]Informs host of primary and secondary loop timing clock sources configured from ring timing on the card. For EXNET-ONE cards configured as a Single Ring Redundancy Standby, the Loop Timing fields are always disabled.

Data[0] Primary Loop Timing
0x00 Not Enabled
0x01 Enabled
Data[1] Reserved
Data[2] Secondary Loop Timing
0x00 Not Enabled
0x01 Enabled
Data[3] Reserved

SS7 cards

The system does not report hardware configuration information for these cards.
All bytes are 0x00.

SS7 Multi-Protocol I/O card

Data[0] Channel 0 Data Rate
0x00 64 Kbps
0x01 56 Kbps, for non-V.35 applications
0x80 V.35, 56 Kbps
0x81 48 Kbps, for non-V.35 applications
0xC0 V.35, 48 Kbps

Data[1] Channel 0 Electrical Interface
0x00 V.35, DTE
0x01 V.35, DCE

Data[2] Channel 1 Data Rate (same possibilities as Channel 0, above)
Data[3] Channel 1 Electrical Interface (same possibilities as Channel 0, above)
Data[4] Channel 2 Data Rate (same possibilities as Channel 0, above)
Data[5] Channel 2 Electrical Interface (same possibilities as Channel 0, above)
Data[6] Channel 3 Data Rate (same possibilities as Channel 0, above)
Data[7] Channel 3 Electrical Interface (same possibilities as Channel 0, above)

VDAC-ONE card

Data[0] Number of VoIP Modules (1 - 4)
Data[1] Number of channels supported (MSB)
Data[2] Number of channels supported (LSB)
Data[3] Installed VoIP Modules (Bit Field):
 Bit 0 VoIP Module 0 (0 = not installed, 1 = installed)
 Bit 1 VoIP Module 1 (0 = not installed, 1 = installed)
 Bit 2 VoIP Module 2 (0 = not installed, 1 = installed)
 Bit 3 VoIP Module 3 (0 = not installed, 1 = installed)
Data[4] Module 0 state (0x05=ready, other values=not ready)
Data[5] Module 1 state (0x05=ready, other values=not ready)
Data[6] Module 2 state (0x05=ready, other values=not ready)
Data[7] Module 2 state (0x05=ready, other values=not ready)
Data[8] Port Consumption Mode
 1 Reserved
 2 Port-Consuming
Data[9-15] Reserved (should be zero)

CCS Redundancy Configure 0x005B

SwitchKit Name CCSRedundancyConfig

Type EXS API and SwitchKit API message

Description **CCS Redundancy Configure 0x005B**

This message configures a chassis for common channel signaling (CCS) redundancy. When the system is successfully configured, all configuration and call processing is mirrored on the secondary card. If the primary card fails, the secondary card resumes call processing where the primary left off. You enter the slot number of the primary and secondary SS7 or ISDN cards (using an AIB), and a configuration option to suspend synchronization or to not suspend synchronization.

Related Message *CCS Redundancy Report 0x0073* (CCSRedundancyReport)

CAUTION

Dialogic strongly recommends sending this message during minimal call processing loads only. Replicating database and call processing information entails heavy processor bandwidth, which affects call processing performance and throughput.

Sent by Host

SwitchKit Code **Configuration**

```
CCSRedundancyConfig (
    Node = integer,
    PrimaryCard = integer,
    SecondaryCard = integer,
    RedundancyType = integer);
```

C Structure

```
typedef struct {
    UBYTE PrimaryCard;
    UBYTE SecondaryCard;
    UBYTE RedundancyType;
} XL_CCSRedundancyConfig;
```

C++ Class

```
class XLC_CCSRedundancyConfig : public
    XLC_OutboundMessage {
public:
    UBYTE getPrimaryCard() const;
    void setPrimaryCard(UBYTE x);
```

```

UBYTE getSecondaryCard() const;
void setSecondaryCard(UBYTE x);
UBYTE getRedundancyType() const;
void setRedundancyType(UBYTE x);
};
    
```

CCS Redundancy Query 0x006C

SwitchKit Name CCSRedundancyQuery

Type EXS API and SwitchKit API message

Description **CCS Redundancy Query 0x006C**

Use this message to query the redundancy status (primary or secondary) of common channel signaling (CCS) cards installed in the system. If a redundant pair of cards is installed, the status of both cards is reported.

Related Messages

- *CCS Redundancy Configure* 0x0073 (CCSRedundancyConfig)

CCS Redundancy Report 0x0073

SwitchKit Name CCSRedundancyReport

Type EXS API and SwitchKit API message

Description **CCS Redundancy Report 0x0073**

This message informs the host that either a pair of common channel signaling (CCS) cards is available or a switchover is occurring in the system. This is initiated by the CSP redundancy manager on a redundancy state change.

Related Messages

Channel Parameter Query 0x0080

SwitchKit Name ChannelParameterQuery

Type EXS API and SwitchKit API message

Description **Channel Parameter Query 0x0080**

This message is used to query signaling timers and filters and configuration for Channel Associated Signaling (CAS) channels. The message response is formatted differently depending on the trunk type of the channel.

- PPL Format: E-ONE, T-ONE, SE1LC cards
- Non-PPL: T-ONE or ST1LC card using non-PPL format.

This message handles all DS3 functionality, including enabling and disabling loop back configuration and loop back queries. You must specify the slot number and the DS3 offset. You must take a DS3 span out of service before you can place it into remote loop back.

Do not use this message for Common Channel Signaling (CCS) channels. For ISDN, use the *B Channel Query* message. For SS7, use the *SS7 CIC Query* message.

NOTE: The message format to query PPL channels includes a Response Format field. For backward compatibility, if no value is present, the response will be in non-PPL format.

Channel Release Request 0x0037

SwitchKit Name	ChannelReleaseRequest
Type	EXS API and SwitchKit API message
Description	<p>Channel Release Request 0x0037</p> <p>The conditions in which the CSP uses this message depends on the protocol you are using.</p> <p>SS7 An SS7 channel reports this message to the host if both of the following conditions exist:</p> <ul style="list-style-type: none"> • The SS7 channel is connected to a channel that is released • The release modes for the channels call for the SS7 channel to be released <p>This lets the host insert parameters for the outgoing ISUP REL using the <i>Release Channel With Data</i> message. If no data is to be inserted, the host may use the <i>Release Channel</i> message.</p> <p>ISDN The CSP sends this message to the host upon a network-initiated <i>ISDN Disconnect</i> message if the ISUP mode configuration is set to allow release upon a disconnect. The host responds with either a <i>Release Channel</i> message or a <i>Release Channel With Data</i> message to send information to the ISDN with the release.</p> <p>Sent by CSP</p>

Channel Released 0x0049

SwitchKit Name ChannelReleased

Type EXS API and SwitchKit API message

Description: **Channel Released 0x0049**

This message informs the host that a channel has been released, is in an idle state, and is ready for incoming or outgoing calls.

Sent by: CSP

Resent in EXS API This message is resent once after five seconds.

SwitchKit Code **C Structure:**

```
typedef struct {
    unsigned short Span;
    UBYTE Channel;
} XL_ChannelReleased;
```

C++ Class:

```
class XLC_ChannelReleased : public XLC_OneChannelMessage

Channel Released With Data 0x0069

SwitchKit Name ChannelReleasedWithData

Type EXS API and SwitchKit API message

Description **Channel Released With Data 0x0069**

This message indicates that the network has initiated a release with associated data. If no parameter data is associated with the call release, then a *Channel Released* (0x49) message is sent instead.

For a VoIP call, a Release TLV will appear in the message in the Extended ICB. For SS7 TUP, Release parameters are included in a BT IUP parameters ICB. When BT IUP is configured, then a BT IUP ICB with a release TLV may be present.

For SwitchKit Only

When an ICBType field is set to 0x03, use the following methods for extracting the data of the fields shown in the following table.

If the field is...	then the method for extracting the data is...
ICBSubType	sk_extractExtendedICBFromChannelReleasedWithData()
ICBLength	sk_extractExtendedICBFromChannelReleasedWithData()
ICBData	sk_extractExtendedICBFromChannelReleasedWithData()
getICBSubType()	getExtendedICBSubtype()
getICBLength()	getExtendedICBLength()
getICBData()	getExtendedICBData()

Sent by CSP

Resent in EXS API This message is resent once after five seconds.

Example Message (Log Output in SwitchKit)

The following socket log output/example message is an H.323 call, that the network has initiated a release with a Release TLV indicating Invalid Permission Chosen, Facility Call Deflection.

ChannelGroupContentsQuery

Type: EXS SwitchKit API message

Description Use the *SK_ChannelGroupContentsQuery* to query the contents of the channel group by name. The acknowledgment *SK_ChannelGroupContentsQueryAck* contains the number of channels in that group as well as all the spans and channels.

To process all these channels, you use the following code:

```
SK_MSG_SWITCH(msg) {
    CASE_ChannelGroupContentsQueryAck(ack) {
        int i;
        UBYTE *dta = ack->Channels;
        for (i=0;i<ack->NumChannels;i++)
        {
            short span = ntohs(*(short *)dta);
            int chan = (int)dta[2];
            processChannel(span,chan);
            dta += 3;
        }
    }
} SK_END_SWITCH;
```

The format of the Channels data structure is two bytes for the span in network byte order, followed by one byte representing the channel offset.

Sent by Application

C Structure

```
typedef struct {
    char GroupName[50];
    UBYTE reserved67[23];
} SK_ChannelGroupContentsQuery;
```

C Structure Response

```
typedef struct {
    int Status;
    int NumChannels;
    UBYTE Channels[245];
} SK_ChannelGroupContentsQueryAck;
```

C++ Class

```
class SKC_ChannelGroupContentsQuery : public
    SK_ToolkitMessage {
public:
    const char *getGroupName() const;
    void setGroupName(const char *x);
};
```

C++ Class Response

```
class SKC_ChannelGroupContentsQueryAck : public
    SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
    int getNumChannels() const;
    void setNumChannels(int x);
    const UBYTE *getChannels() const;
    UBYTE *getChannels();
    void setChannels(UBYTE *x);
};
```

Status Field Return Values

The possible status values are:

OK

Query successful acknowledged.

SK_INVALID_GROUP

The GroupName in the query does not exist.

Arguments

GroupName: Name of Group to be queried.

ChannelGroupPopulationQuery

Type:	EXS SwitchKit API message
Description	Use the <i>SK_ChannelGroupPopulationQuery</i> message to query the existing defined channel groups on the LLC. The GroupNames field contains a set of group names, each separated by the NULL character. For example, to loop over all the groups, as returned by this message, you could use the following code:
	<pre>SK_MSG_SWITCH(msg) { CASE_ChannelGroupPopulationQueryAck(ack) { int i; char *gps = (char *)ack->GroupNames; for (i=0;i<ack->NumGroups;i++) { char *aGroup = gps; processGroup(aGroup); gps += strlen(gps) + 1; } } } SK_END_SWITCH;</pre>
Sent by	Application
C Structure	<pre>typedef struct { } SK_ChannelGroupPopulationQuery;</pre>
C Structure Response	<pre>typedef struct { int Status; int NumGroups; UBYTE GroupNames[245]; } SK_ChannelGroupPopulationQueryAck;</pre>
C++ Class	<pre>class SKC_ChannelGroupPopulationQuery : public SKC_ToolkitMessage { public: };</pre>

ChannelGroupPopulationQuery

Return Status Always 0x10

ChannelProblem

Type:	EXS SwitchKit API message
Description	<p>This message is generated by SwitchManager. To do this, SwitchManager must be running in order for an application to receive a channel problem message. An application can receive a message when a channel has encountered some problems, but has not gone out-of-service. The application also receives this message when the problem clears.</p> <p>ErrorNum equals one (1) if a red or yellow span alarm occurs; or equals two (2) if a PPL Event Indication occurs. The LLC does not allocate a channel that is in an alarm state, but if an application already has a channel that has entered into an alarm state, the application must deal with this state. Text will contain a description of the problem, which in the case of red and yellow alarms is a description of the current network status. A problem with a value of one (1) means the problem just occurred; a value of zero (0) means the problem has cleared. In the case of a span alarm, Data1 will equal the status field extracted from the EXS API message. In the case of a PPL Event Indication, Data1 will equal the PPL Event.</p>
Sent by	SwitchManager; forwarded by LLC
C Structure	<pre>typedef struct { unsigned short Span; UBYTE Channel; UBYTE Problem; UBYTE ErrorNum; UBYTE Data1; UBYTE Data2; char Text[200]; } SK_ChannelProblem;</pre>

ChannelProblem

```
UBYTE getData2() const;  
void setData2(UBYTE x);  
const char *getText() const;  
void setText(const char *x);  
};
```

Clear System Software 0x000C

SwitchKit Name	ClearSystemSoftware
Type	EXS API and SwitchKit API message
Description	Clear System Software 0x000C

NOTE: This message is for use in a **lab environment only**. You must not send this message to a live system.

This message clears the system software stored in memory on the CSP Matrix Series 3 Card. Use this message immediately before you send a new load to the CSP Matrix Series 3 Card. To stop the running system software, push the Reset button or send a *Reset Matrix* message.

System software is copied into maintained storage. Upon reset or boot, software is copied from maintained storage to RAM for execution. When the host sends this message, the copy in maintained storage is cleared, but the RAM is unaffected.

If a card resets after you send this message, the card will not retrieve a software load from maintained storage and will not come back into service.

Redundant Matrix Cards

In a redundant system, sending this message to the active CSP Matrix Series 3 Card clears both CSP Matrix Series 3 Card. After sending this message to the active CSP Matrix Series 3 Card, you must send a *Reset Matrix* message to **both** CSP Matrix Series 3 Card.

Sent by Host

Related API Message *Reset Matrix* 0x009D (ResetMatrix)

SwitchKit Code **C Structure**

```
typedef struct {
    } XL_ClearSystemSoftware;
```

C++ Class

```
class XLC_ClearSystemSoftware : public
    XLC_OutboundMessage {
public:
    };
```

EXS API Hex Format

MESSAGE (White)		RESPONSE (Gray)

ClearAllChanGroups

Type:	EXS SwitchKit API message
Description	Use the <i>SK_ClearAllChanGroups</i> message to remove all channel groups.
Sent by	SwitchManager
Configuration	<i>ClearAllChanGroups</i> ();
C Structure	<pre>typedef struct { } <i>SK_ClearAllChanGroups</i> ;</pre>
C++ Class	<pre>class <i>SKC_ClearAllChanGroups</i> : public SKC_AdminMessage{ public: };</pre>

ClearChanGroup

Type:	SwitchKit API message
Description	Use the <i>SK_ClearChanGroup</i> message to remove all channels from a channel group. Because channel group bindings accumulate for as long as the LLC is running, it is recommended that you clear every channel group that you use in a configuration file.
Sent by	SwitchManager
Configuration	<i>ClearChanGroup</i> (ChannelGroup = string);
C Structure	<pre>typedef struct { char ChannelGroup[45]; } <i>SK_ClearChanGroup</i>;</pre>
C++ Class	<pre>class <i>SKC_ClearChanGroup</i> : public SKC_AdminMessage { public: const char *getChannelGroup() const; void setChannelGroup(const char *x); };</pre>

ClearLog

Type	SwitchKit API message
Description	The <i>ClearLog</i> message is used as an operations, administration and maintenance feature in the Converged Services Administrator (CSA) to clear log files. You can choose among different options to clear log files.
Sent by	Application or CSA
How to use	To use a <i>ClearLog</i> message, construct the message and set the LoggingBitMask: <pre>SKC_ClearLog cl; UBYTE log_bit_mask = SK_CLEAR_MSG_LOG SK_CLEAR_SOCKET_LOG; cl.setLoggingBitMask(log_bit_mask);</pre>
Argument Values	The following table shows the common values of the LoggingBitMask argument. You can combine two or more values with a logical OR to clear several logs at once.

Clear individual log files using the following values:

Argument Value	Description
SK_CLEAR_MSG_LOG	Clears only the messages log file.
SK_CLEAR_MAINT_LLC_LOG	Clears only the LLC maintenance log.
SK_CLEAR_SOCKET_LOG	Clears only the socket log file.
SK_CLEAR_ALARM_LOG	Clears only the alarm log file.
SK_CLEAR_MAINT_SWMGR_LOG	Clears only the SwitchManager maintenance log file.

Clear groups of log files using the following values:

Argument Value	Description
SK_CLEAR_ALL_SK_LOGS	Clears all the SwitchKit logs.
SK_CLEAR_ALL_LLC_LOGS	Clears all LLC logs, including: SK_CLEAR_MSG_LOG SK_CLEAR_MAINT_LLC_LOG SK_CLEAR_SOCKET_LOG

SK_CLEAR_ALL_SWMGR_LOGS	Clears all SwitchManager logs, including: SK_CLEAR_ALARM_LOG SK_CLEAR_MAINT_SWMGR_LOG

Clear IP Signaling Series 3 Card 0x0108

Type EXS API message

Description **Clear IP Signaling Series 3 Card 0x0108**

This message clears the system software on the IP Signaling Series 3 card before and/or after the IP Signaling Series 3 card interface is established. This message is sent directly to the IP Signaling Series 3 card and uses the extended logical node ID format.

To initiate the download of the new software load, you need to reset the IP Signaling Series 3 card by pushing the Reset button or using the *Reset IP Signaling Series 3 Card* message (0x0107).

Sent by Host

Example Message The following clears the system software on the IP Signaling Series 3 card when the IP Signaling Series 3 card ID or Matrix ID is not assigned.

00 11 01 08 00 00 fe 00 02 52 02 ff ff 53 04 00 20 ff ff

ClearSoftware

- Type:** SwitchKit API message
- Purpose** Use the *ClearSoftware* message to clear system software and to reset the CSP Matrix Series 3 Card or device server of the CSP.
- Description** This message is used for clearing system software and for resetting the the CSP Matrix Series 3 Card(s).
- Sent by** Application or CSA
- How to use** To use a *ClearSoftware* message, construct the message and set the matrix and action arguments as shown below:
- ```
SKC_ClearSoftware cls();
cls.setMatrix(matrix);
cls.setAction(action);
cls.setNodeId(node);
```
- Arguments** The following table shows the arguments you can change:

| Arguments | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Matrix    | <p>This argument specifies on which CSP Matrix Series 3 Card the action is applied:</p> <p>SK_CLEARSW_ACTIVE (1) = Apply action to active CSP Matrix Series 3 Card</p> <p>SK_CLEARSW_STANDBY (2) = Apply action to standby CSP Matrix Series 3 Card</p> <p>SK_CLEARSW_ALL (3) = Apply action on both CSP Matrix Series 3 Card in the CSP</p> |
| Action    | <p>This argument specifies which action is applied:</p> <p>SK_CLEARSW_CLEAR (1) = Clear software but do not reset the CSP Matrix Series 3 Card.</p> <p>SK_CLEARSW_CLEAR_AND_RESET (2) = Clear software and reset the CSP Matrix Series 3 Card.</p>                                                                                           |

| <b>Arguments</b> | <b>Description</b>                                                                                                                                                       |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node             | This argument specifies the logical node ID of the CSP Matrix Series 3 Card pair or the Device Server ID of the Device Server card to which the action is to be applied. |

**Status Field** The following table shows the possible return values of the status field. The status field can contain any of the values or the logical OR combination of two or more of the following:

| Value                           | Description                                                                     |
|---------------------------------|---------------------------------------------------------------------------------|
| SK_SUCCESS (0x10)               | Message successfully executed.                                                  |
| SK_ACTIVE_NOT_CLEARED (0x0001)  | The active CSP Matrix Series 3 Card was not cleared.                            |
| SK_STANDBY_NOT_CLEARED (0x0002) | The standby CSP Matrix Series 3 Card was not cleared.                           |
| SK_ACTIVE_NOT_RESET (0x0004)    | The active CSP Matrix Series 3 Card was not reset.                              |
| SK_STANDBY_NOT_RESET (0x0008)   | The standby CSP Matrix Series 3 Card was not reset.                             |
| SK_INVALID_NODE (0xf002)        | This indicates that the application has no description data associated with it. |

**C Structure**

```
typedef struct {
 UBYTE Matrix;
 UBYTE Action;
 unsigned short NodeId;
} SK_ClearSoftware;
```

**C++ Class**

```
class SKC_ClearSoftware : public SKC_ToolkitMessage {
public:
 UBYTE getMatrix() const;
 void setMatrix(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
 unsigned short getNodeid() const;
 void setNodeid(unsigned short x);
};
```

## Collect Digit String 0x00BC

---

**SwitchKit Name** CollectDigitString

**Type** EXS API and SwitchKit API message

**Description** **Collect Digit String 0x00BC**

This message instructs the CSP to attach a digit receiver to the specified channel.

**NOTE:** The digit receiver collects digit strings only if the digits are either DTMF or MFR1, or if the call is in a state other than idle, out of service, or busied out

Once the receiver has collected the digits, the CSP sends a *Call Processing Event* message with the value 0x02 (Digits) in the *Call Processing Event* field. If an error occurs, the CSP sends a *Call Processing Event* message and indicates the error using the *Status* field.

If the host sends this message and specifies a channel to which a digit receiver is already attached, the CSP sends the host a response with a status of 0x30 (DSP Resource Already Allocated). The channel is not affected.

The CSP releases the digit receiver from the channel when one of the following occurs:

- The CSP sends a *Call Processing Event* message
- The call is released
- The CSP receives a *DSP Service Cancel* message from the host

**Sent by** Host Application

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE Mode;
 UBYTE MaxDigits;
 UBYTE NumTermChars;
 UBYTE ConfigBits;
 unsigned short TermChars;
 unsigned short InterDigitTimer;
 unsigned short FirstDigitTimer;
 unsigned short CompletionTimer;
 unsigned short MinReceiveDigitDuration;
 UBYTE AddressSignallingType;
 UBYTE NumDigitStrings;
 unsigned short ResumeDigitCltnTimer;
} XL_CollectDigitString;
```

### C++ Class

```
class XLC_CollectDigitString : public
 XLC_OneChannelOutbound {
public:

| <b>Entity Options</b> | <p><b>Entity</b></p> <p>0 - Allocation Pattern<br/>Controls the order in which LLC will allocate the channels when you request a channel in a channel group.</p>                                                                                                              |

### Parameters for Allocation Pattern

| Value     | Allocator   | Description                                                                                                                                                      |
|-----------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 default | Round Robin | Begins with the first available channel, and proceeds through the group, always choosing the next available channel starting from the channel it last allocated. |
| 1         | Ascending   | Always chooses the first (i.e., lowest numbered) available channel in the group.                                                                                 |

## ConfigChanGroup

| <b>Value</b> | <b>Allocator</b>          | <b>Description</b>                                                         |
|--------------|---------------------------|----------------------------------------------------------------------------|
| 2            | Descending                | Chooses the last (highest numbered) available channel in the group.        |
| 3            | LRU (Least Recently Used) | Chooses the channel that has been in the idle state for the longest time.  |
| 4            | MRU (Most Recently Used)  | Chooses the channel that has been in the idle state for the shortest time. |

**Example** *ConfigChanGroup* (  
ChannelGroup = "outbound",  
Entity = 0,  
Parameter = 1);

| <b>Purpose</b>      | <p>SwitchManager sends the <i>SK_ConfigStatusMsg</i> message to a registered application at configuration time.</p> <p>An application can register to receive this message when SwitchManager configures the entire CSP or a part of an CSP configuration, including start-up, a dynamic change request, or a matrix failure. SwitchManager tracks when the configuration begins, when it ends, and the number of positive and negative ACKs received.</p> <p>To receive the message <i>SK_ConfigStatusMsg</i>, your application must register for this message using the <code>sk_msgRegister()</code> function. The application should not send an acknowledgement for this message.</p> <p>If SwitchManager is run with <code>-s</code> option and if there was no configuration message sent to the CSP, SwitchManager will not send any <i>SK_ConfigStatusMsg</i>.</p> |
| <b>Sent by</b>      | SwitchManager                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| SK_CARD_RECONFIG    | Node, Slot, CardType |
| SK_CONFIG_TAG_RESET | Node, Slot, CardType |

# ConfigSwitch

---

**Type:** SwitchKit API message

**Purpose** Use the *SK\_ConfigSwitch* message to dynamically configure the switch without sending a configuration file.

**Description** *SK\_ConfigSwitch* uses the bytes of the message as parameters. The acknowledgement *SK\_ConfigSwitchAck* contains a status value from SwitchKit and a status value from the switch.

**How to use SK\_ConfigSwitch** You have to declare a C Structure to contain a configuration that will be sent to the switch. Use the function *sk\_packMessage*(MsgStruct \*m, char \*data, int \*NumBytes) to find out the fields NumBytes and Data. Send the message to the LLC using its member function send(). Wait for an acknowledgment, the status fields give information about the configuration message.

When you send the *SK\_ConfigSwitch* message, SwitchManager extracts it using the function *sk\_unpackMessage*() and sends the extracted information to the switch. Before SwitchManager can send an acknowledgment, it must wait until the switch processes the configuration. During this time, it is not possible to send another *SK\_ConfigSwitch* message to the switch. If another *SK\_ConfigSwitch* message is sent before receiving an acknowledgment, SwitchManager will NACK the second message. The SKStatus field will indicate this with SK\_NOT\_READY.

**Sent by** CSA or Application

**Field Values** The following table shows the possible field values for this message:

| Field   | Values and Description                                                                                                                                                                                                                                                   |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | <ul style="list-style-type: none"> <li>0 = Do not send or process the message yet, there are more to come. SwitchManager stores the message in a TEMP collection.</li> <li>1 = Send this message and all the messages previously added using Action set to 0.</li> </ul> |
| Offline | <ul style="list-style-type: none"> <li>0 = Process and send the message.</li> <li>1 = Process the message but do not send it.</li> </ul>                                                                                                                                 |

## Conference Create 0x004B

---

**SwitchKit Name** ConferenceCreate

**Type** EXS API and SwitchKit API message

**Description** **Conference Create 0x004B**

**NOTE:** If you are using the DSP Series 2 card, use the *Resource Create 0x0124* message to create a conference.

Use this message to create a multi-channel conference on the MFDS or DSP-ONE card. A DSP configured for conferencing may have more than one conference created on it, in any combination of the maximum allowed channels.

Use the Conference ID returned by the CSP for any further references to the conference. The CSP assigns Conference IDs in descending order as they are created.

You receive a NACK of 0x2D (Incompatible PCM Encoding for Conference) if a channel from a remote node tries to connect 1-Way to a conference and the encoding type does not match the broadcast type set during the conference creation.

You cannot use the following Conference Types with the DSP Series 2 card:

- A-law Standard
- $\mu$ -law Standard
- Mixed

**Sent by** Host

**Example Message  
(Socket Log Output for  
SwitchKit)**

For EXS API, the following example message configures a unified conference of 25 channels with broadcast enabled.

For SwitchKit, the following socket log output shows configuration of a unified conference of 25 channels with broadcast enabled.

```
00 08 00 4B 00 00 FF 19 25 01
```

```
00 08 Message Length
```

```
00 4B Message Type
```

```
00 Reserved
```

```
00 Sequence Number
```

```
FF Logical Node ID (Single Node)
```

```
19 Conference Size (25 channels)
```

```
25 Conference Type (Any channel, Any DSP Unified)
```

```
01 Broadcast Enable (Broadcast Enabled)
```

The following example is for any channel, any DSP, Unified Dynamic, u-law conference of 25 channels, with broadcast enabled:

```
00 08 Message Length
00 4B Message Type
00 Reserved
00 Sequence Number
FF Logical Node ID (Single Node)
19 Conference Size (25 channels)
27 Conference Type
 (Any channel, Any DSP, Unified Dynamic, μ -law)
01 Broadcast Enable (Broadcast Enabled)
```

### SwitchKit Code C Structure

```
typedef struct {
 UBYTE ConferenceSize;
 UBYTE ConferenceType;
 UBYTE BroadcastEnable;
} XL_ConferenceCreate;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short ConferenceID;
} XL_ConferenceCreateAck;
```

### C++ Class

```
class XLC_ConferenceCreate : public XLC_OutboundMessage {
public:
 UBYTE getConferenceSize() const;
 void setConferenceSize(UBYTE x);
 UBYTE getConferenceType() const;
 void setConferenceType(UBYTE x);
 UBYTE getBroadcastEnable() const;
 void setBroadcastEnable(UBYTE x);
};
```

### C++ Class Response

```
class XLC_ConferenceCreateAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

**EXS API Hex Format**

# Conference Delete Request 0x004C

---

|                       |                                         |
|-----------------------|-----------------------------------------|
| <b>SwitchKit Name</b> | ConferenceDeleteRequest                 |
| <b>Type</b>           | EXS API and SwitchKit API message       |
| <b>Description</b>    | <b>Conference Delete Request 0x004C</b> |

**NOTE:** If you are using the DSP Series 2 card, use the *Resource Delete 0x0126* message to delete a conference.

Use this message to delete a conference on the MFDSP or DSP-ONE card. A response *Status* value of positive acknowledgment (0x0010) indicates that conference deletion has been “initiated” by the CSP. When deletion is complete, the CSP will send a *Conference Deleted* (0x004D) message to the host.

To delete all conferences, specify **0xFFFF** in the *Conference ID* field.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short ConferenceID;
 UBYTE ForcedFlag;
} XL_ConferenceDeleteRequest;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short ConferenceID;
} XL_ConferenceDeleteRequestAck;
```

### C++ Class

```
class XLC_ConferenceDeleteRequest : public
 XLC_OutboundMessage {
public:
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
 UBYTE getForcedFlag() const;
 void setForcedFlag(UBYTE x);
};
```

### C++ Class Response

```
class XLC_ConferenceDeleteRequestAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

};

# Conference Deleted 0x004D

---

**SwitchKit Name** ConferenceDeleted

**Type** EXS API and SwitchKit API message

**Description** **Conference Deleted 0x004D**

**NOTE:** If you are using the DSP Series 2 card, you will receive a *Resource Delete Indication 0x0129* message to indicate a conference has been deleted.

This message is sent to the host after a conference on an MFDSP or DSP-ONE card is deleted (for example, all channels in the conference are released and the DSP resource is freed up).

**Sent by** CSP

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short ConferenceID;
} XL_ConferenceDeleted;
```

**C++ Class**

```
class XLC_ConferenceDeleted : public XLC_InboundMessage {
public:
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

**Resent in EXS API** This message is resent once after five seconds.

## Connect 0x0000

---

**SwitchKit Name** Connect

**Type** EXS API and SwitchKit API message

**Description** **Connect 0x0000**

This message instructs the CSP to establish a two-way connection between the two channels specified, for example, Channel A and Channel B.

If there is no active call up for Channel B, a seizure will be generated on that channel, and once seize ACKs have been met, the voice path is connected.

**NOTE:** This message treats the first span/channel and the second span/channel the same regardless of their inbound or outbound nature. Therefore, the answer supervision mode of only the second span/channel is meaningful in the *Connect* API message.

**Sent by** Host

**Example Message (Socket Log Output for SwitchKit)**

For EXS API, the example message below configures the CSP to establish a two-way connection between span 01 channel 01 and span 02 channel 02:  
For SwitchKit, the socket log output below shows configuration of the CSP, which establishes a two-way connection between span 01 channel 01 and span 02 channel 02:

```
00 11 00 00 00 00 FF 00 02 0D 03 00 01 01 0D 03 00 02 02
```

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
} XL_Connect;
```

**C++ Class**

```
class XLC_Connect : public XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
 void setChannelB(UBYTE x);
```

};

**EXS API Hex Format**

## Connect One-Way To Conference 0x004F

---

**SwitchKit Name** ConnectOneWayToConference

**Type** EXS API and SwitchKit API message

**Description** **Connect One-Way To Conference 0x004F**

**NOTE:** If you are using the DSP Series 2 card, use the *Resource Connect 0x0127* message to connect to a conference. Use the Connection Type TLV to make a one-way connection.

Use this message with the MFDSP or DSP-ONE card to establish a one-way (listen only) connection between the channel specified and the previously created conference specified. The channel should be in one of the following states: idle, in seized, parked, or out seized.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 unsigned short ConferenceID;
} XL_ConnectOneWayToConference;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectOneWayToConferenceAck;
```

**C++ Class**

```
class XLC_ConnectOneWayToConference : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 unsigned short getConferenceID() const;
 void setConferenceID(unsigned short x);
};
```

**C++ Class Response**

```
class XLC_ConnectOneWayToConferenceAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
```

Connect One-Way To Conference 0x004F

```

unsigned short getSpan() const;
void setSpan(unsigned short x);
UBYTE getChannel() const;
void setChannel(UBYTE x);
};

```

**EXS API Hex Format**

## Connect To Conference 0x004E

---

**SwitchKit Name** ConnectToConference

**Type** EXS API and SwitchKit API message

**Description** **Connect To Conference 0x004E**

**NOTE:** If you are using the DSP Series 2 card, use the *Resource Connect 0x0127* message to connect to a conference.

Use this message to add a channel to a conference on an MFDSP or DSP-ONE card. The channel to be added to a conference must be in one of the following states: in seized, parked, connected, or out seized.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 unsigned short ConferenceID;
} XL_ConnectToConference;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectToConferenceAck;
```

### C++ Class

```
class XLC_ConnectToConferenceAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

### C++ Class Response

```
class XLC_ConnectToConference : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 unsigned short getConferenceID() const;
```

```
void setConferenceID(unsigned short x);
};
```

## Connect One-Way Forced 0x0050

---

**SwitchKit Name** ConnectOneWayForced

**Type** EXS API and SwitchKit API message

**Description** **Connect One-Way Forced 0x0050**

This message establishes a one-way connection between two channels, where Channel A is the source channel (talk only) and Channel B is the destination channel (listen only).

With this connection, the CSP does not do any checking on the state of Channel A; it can be in any state. This lessens the degree of call processing required, resulting in a significantly faster call rate. Channel B, however, must be in an acceptable connection state.

The connection will only be torn down if Channel B is released by the host, or as a result of a network-initiated release.

When performing a “Connect One-Way Forced A-to-B” on a multi-node system, you must send this message to the node containing the “B” channel.

For SwitchKit: If you use the ConnectOneWayForced message in your call control application, you need to specify which node you want the message to be sent to. You can specify the node within the C Structure field BaseFields Base (NodeID) or within in the C++ Class through inheritance from SKC\_Message (getNode, setNode).

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
 UBYTE BPad;
} XL_ConnectOneWayForced;
```

**C++ Class**

```
class XLC_ConnectOneWayForced : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
 void setChannelB(UBYTE x);
 UBYTE getBPad() const;
 void setBPad(UBYTE x);
```

};

## Connect Tone Pattern 0x002F

---

**SwitchKit Name** ConnectTonePattern

**Type** EXS API and SwitchKit API message

**Description** **Connect Tone Pattern 0x002F**

This message instructs the CSP to transmit a call progress pattern ID to the specified channel. The channel must be in any state other than: idle, out of service, or busied out.

If you want to be notified with a *Call Processing Event* message (0x21 - Tone Complete) when tone transmission has stopped, set the *Generate Event Flag*.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE reserved20[27];
 UBYTE CallProgressPatternID;
 unsigned short NumCycles;
 UBYTE Flag;
 UBYTE reserved51[219];
} XL_ConnectTonePattern;
```

**C++ Class**

```
class XLC_ConnectTonePattern : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getCallProgressPatternID() const;
 void setCallProgressPatternID(UBYTE x);
 unsigned short getNumCycles() const;
 void setNumCycles(unsigned short x);
 UBYTE getFlag() const;
 void setFlag(UBYTE x)
};
```

**EXS API Hex Format**

# Connect Wait 0x0017

---

**SwitchKit Name** ConnectWait

**Type** EXS API and SwitchKit API message

**Description** **Connect Wait 0x0017**

This message instructs the CSP to suspend the processing of an incoming call on a channel. This message may be used by the host as a response to the *Request for Service* message sent by the CSP.

The CSP stops resending the *Request for Service* message for the channel and waits for a connection management message such as *Park Channel*, *Connect*, and so on.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectWait;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Channel;
} XL_ConnectWaitAck;
```

**C++ Class**

```
class XLC_ConnectWait : public XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
};
```

**C++ Class Response**

```
class XLC_ConnectWaitAck : public XLC_AcknowledgeMessage
{
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

**EXS API Hex Format**

## Connect With Data 0x0005

---

|                                    |                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SwitchKit Name</b>              | ConnectWithData                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Type</b>                        | EXS API and SwitchKit API message                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>                 | <p><b>Connect With Data 0x0005</b></p> <p>This message instructs the CSP to connect two channels.</p> <p>This message also supports canceling digit collection, playing of call progress tones, voice path connect functionality, and dynamic configuration of release modes.</p>                                                                                                   |
| <b>ISDN</b>                        | If the terminating channel is not in an idle state, after seizure the alerting and connect indications will get propagated to the incoming side and the data specified in this message will get sent to the incoming ISDN channel.                                                                                                                                                  |
| <b>SS7</b>                         | You can use this message to pass parameter data for the ACM, ANM, or CON (ITU-TS only) in a connection between an incoming SS7 call (A Party) and another channel.                                                                                                                                                                                                                  |
| <b>SIP (Call Agent)</b>            | The message carries the B side SDP (Session Description Protocol) information to the CSP in an NPDI Universal ICB and Generic PPL ICB. In a Generic PPL ICB, the Channel Service TLV indicates whether a bearer-switched or bearer-free connection is requested. For a bearer-free connection, the B side connection information is passed in the NPDI Universal ICB from the host. |
| <b>Sent by</b>                     | Host                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Example Message for EXS API</b> | <p>The following example message uses the Release Mode Configure ICB in a <i>Connect With Data</i> message to park Channel A (Span 0, Channel 0) and release Channel B (Span 0, Channel 1).</p> <pre>00 0D 00 05 00 00 FF 01 02 0D 03 00 00 00 0D 03 00 00 01   01 01 01 02 02 01 02</pre>                                                                                          |

# ConnectionStatusMsg

---

**Type:** EXS SwitchKit API message

**Description** This message is sent by the Low-Level Communicator (LLC) to an application whenever any application connects to or disconnects from the LLC. These notifications go to applications. All applications connect to LLC. By default, LLC will send **ConnectionStatusMsg** messages to all applications. To disable this functionality, set `SK_DISABLE_CSM =1`.

**NOTE:** An application can use this message to determine that a software version mismatch has occurred. In this case, an application receives a **ConnectionStatusMsg** with status 0x06, which indicates there is an invalid connection. The application needs to manually delete the connection, otherwise, a loop will continue. In CSA, you will receive an error message saying the LLC is a different version of software and you should upgrade CSA for it to work.

This feature is also used, for example, to detect whether an application in a redundant pair disconnects. This includes notification of an LLC or SwitchManager switchover. In a redundant LLC set-up, if the primary LLC fails, a **ConnectionStatusMsg** is sent, stating that an application with the LLC name of '0' has disconnected. The '0' corresponds to the primary LLC.

There are two types of applications:

- Special Applications
  - SwitchManger and Redundant LLC (RLLC) are special applications. SwitchManger always connects to the LLC as the application named 1. RLLC always connects to the LLC as the application named 2.
- User Applications
  - User applications, including the Converged Services Administrator, connect to the LLC as applications with names greater than or equal to 10.

In a redundant LLC set-up, if the primary LLC (PLLC) fails, a **ConnectionStatusMsg** is sent, stating that an application with the LLC name of '0' has disconnected. The '0' corresponds to the primary LLC.

By default Switchkit applications, with the wrong version of software, will cause an error when attempting to connect to the LLC. The connection for this faulty application will be made to the LLC, and LLC will then send a **ConnectionStatusMsg** with an error code to all registered applications. All registered Switchkit applications will get a status of `SK_CSM_NoCompat_App_SW (6)` when this occurs.

Once the **ConnectionStatusMsg** had been successfully sent to all registered applications, the LLC will drop the connection, and log the following within the `maintenance_llc.log`:

## ConnectionStatusMsg

```

* Application Connection Failed
*
* Application cannot remain connected to LLC due to incompatible SK API
* software version.
*
* Application software version:08.02.03
* Switchkit software version:08.03.01

```

**Sent by** Application

**C Structure**

```
typedef struct {
 char IPAddress[50];
 UBYTE Status;
 int Name;
 UBYTE reserved72[4];
} SK_ConnectionStatusMsg;
```

**C++ Class**

```
class SKC_ConnectionStatusMsg : public SKC_ToolkitInbound
{
public:
 const char *getIPAddress() const;
 void setIPAddress(const char *x);
 UBYTE getStatus() const;
 void setStatus(UBYTE x);
 int getName() const;
 void setName(int x);
};
```

**Argument Values** The following table shows the possible values for the arguments of this message:

## ConnectionStatusMsg

| <b>Argument</b> | <b>Value</b>                                                                    | <b>Description</b>                                                                                                                                                                                                                                                    |
|-----------------|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <i>SK_CSM_OtherAppIDDropped</i>                                                 | Indicates the application has disconnected.                                                                                                                                                                                                                           |
|                 | <i>SK_CSM_OtherAppIDConnected</i>                                               | Indicates another application has connected. This value is only received, if the application is registered for the connection status message. Then, the application will get the connection status message for itself and all other applications that connect to LLC. |
| Status          | <i>SK_CSM_AppIDReturnedFromPhantom</i>                                          | This is sent when an application reconnects to an LLC, either because it was disconnected and reconnected within the 15 second time-out period, or there was a switchover from the PLLC to the RLLC.                                                                  |
|                 | <i>SK_CSM_CurrentAppIDConnected</i>                                             | The current application has connected to the LLC/ RLLC.                                                                                                                                                                                                               |

## CPC Detection 0x0047

---

**SwitchKit Name** CPCDetection

**Type** EXS API and SwitchKit API message

**Description** **CPC Detection 0x0047**

This message enables or disables the detection of CPC (Calling Party Control), which is needed on FXO/LS channels. CPC is the means by which the calling end notifies the called end that the established connection is no longer needed. In this case, dialtone is used for notification.

This feature can only be activated if the CSP contains an MFDSP or DSP-ONE card with at least one DSP configured for Call Progress Analysis. When CPC is detected, it is reported to the host in a *Call Processing Event* message.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE Action;
} XL_CPCDetection;
```

**C++ Class**

```
class XLC_CPCDetection : public XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
};
```

**EXS API Hex Format**

| MESSAGE (White) |                                                                                                                                                                                                                                                                                                                             | RESPONSE (Gray) |                       |

# CreateConnection

---

**Type:** EXS SwitchKit API message

**Description** An application that needs to connect to a specific LLC must issue a function call **sk\_createConnection()**. The function then uses the *SK\_CreateConnection* message to establish the connection between the LLC and requesting application.

**Important!** It is not possible to send the CreateConnection message directly to the LLC.

**Sent by** Application

**C Structure**

```
typedef struct {
 UBYTE ConnectionID;
 char PriHost[30];
 char RedHost[30];
 unsigned short PriPort;
 unsigned short RedPort;
 UBYTE Action;
} SK_CreateConnection;
```

**C++ Class**

```
class SKC_CreateConnection : public SKC_ToolkitMessage {
public:
 UBYTE getConnectionID() const;
 void setConnectionID(UBYTE x);
 const char *getPriHost() const;
 void setPriHost(const char *x);
 const char *getRedHost() const;
 void setRedHost(const char *x);
 unsigned short getPriPort() const;
 void setPriPort(unsigned short x);
 unsigned short getRedPort() const;
 void setRedPort(unsigned short x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
};
```

# Cross Connect Channel 0x001A

---

**SwitchKit Name** CrossConnectChannel

**Type** EXS API and SwitchKit API message

**Description** **Cross Connect Channel 0x001A**

This message makes a connection between two channels' data paths. No signaling information can be used to detect either channel releasing. The host must tear the connection down using the *Cross Disconnect Channel* message. If you cross-connect T1 and E1 channels, the result is automatic PCM conversion (A-law/ $\mu$ -law). By default, channels on T1 spans are  $\mu$ -law and channels on E1 spans are A-law. To disable conversion, as would be required if you connect through an ISDN D channel or SS7 link, you must configure both channels with the same format using the *PCM Encoding Format Configure* message.

This message is supported by the VDAC-ONE card but not the IP Network Interface Series 2 card.

**NOTE:** When cross-connecting channels across nodes in an CSP system, a separate message must be sent to each channel in the connection.

For example, you would send one message to Node 1: *Cross Connect Channel A, B*. You would send another message to Node 2: *Cross Connect Channel B, A*.

You can use optional fields for Encoding Format and Pad Value, which are described below the message table. The Encoding Format and Pad Value fields are required for cross-connections involving separate nodes in a multi-node system only.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossConnectChannel (
 Node = integer,
 SpanA = integer,
 ChannelA = integer,
 SpanB = integer,
 ChannelB = integer,

## Cross Connect Span 0x001C

---

**SwitchKit Name** CrossConnectSpan

**Type** EXS API and SwitchKit API message

**Description** **Cross Connect Span 0x001C**

This message connects all data paths on Logical Span ID A to data paths on Logical Span ID B.

When in E1 clear channel mode, this message does not connect time slot 16 (channel 30). You must use the *Cross Connect Channel* message to connect the data paths.

Cross-connection of T1 and E1 spans is not supported. Multiframe alignment does not propagate from one side of the connection to the other.

**NOTE:** When cross-connecting channels across nodes in a multi-node system, a separate message must be sent to each channel in the connection.

For example, you would send one message to Node 1: *Cross Connect Span 0,1*. You would send another message to Node 2: *Cross Connect Span 1,0*. You can use optional fields for Encoding Format and Pad Value, which are described below the message table. The Encoding Format and Pad Value fields are required for cross-connections involving separate nodes in a multi-node CSP system only.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossConnectSpan (
 Node = integer,
 SpanA = integer,
 SpanB = integer,
 ChannelAEncoding = integer,
 ChannelAPad = integer,
 ChannelBEncoding = integer,
 ChannelBPad = integer);
```

**C Structure**

```
typedef struct {
 unsigned short SpanA;
 unsigned short SpanB;
 UBYTE ChannelAEncoding;
 UBYTE ChannelAPad;
 UBYTE ChannelBEncoding;
 UBYTE ChannelBPad;
} XL_CrossConnectSpan;
```

**C++ Class**

```
class XLC_CrossConnectSpan : public XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelAEncoding() const;
 void setChannelAEncoding(UBYTE x);
 UBYTE getChannelAPad() const;
 void setChannelAPad(UBYTE x);
 UBYTE getChannelBEncoding() const;
 void setChannelBEncoding(UBYTE x);
 UBYTE getChannelBPad() const;
 void setChannelBPad(UBYTE x);
};
```

**EXS API Hex Format**

# Cross Disconnect Channel 0x001B

---

**SwitchKit Name** CrossDisconnectChannel

**Type** EXS API and SwitchKit API message

**Description** **Cross Disconnect Channel 0x001B**

This message instructs the CSP to disconnect the data paths of the channels specified (for SwitchKit, to disconnect the data paths of the channels that were connected by means of the CrossConnectChannel message).

**NOTE:** When cross-connecting channels across nodes in a CSP system, a separate message must be sent to each channel in the connection.

For example, you would send one message to Node 1:

- *Cross Disconnect Channel* (CrossDisconnectChannel) A, B.

You would send another message to Node 2:

- *Cross Disconnect Channel* (CrossDisconnectChannel) B, A.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossDisconnectChannel (
 Node = integer,
 SpanA = integer,
 ChannelA = integer,
 SpanB = integer,
 ChannelB = integer);
```

**C Structure**

```
typedef struct {
 unsigned short SpanA;
 UBYTE ChannelA;
 unsigned short SpanB;
 UBYTE ChannelB;
} XL_CrossDisconnectChannel;
```

**C++ Class**

```
class XLC_CrossDisconnectChannel : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 UBYTE getChannelA() const;
 void setChannelA(UBYTE x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
 UBYTE getChannelB() const;
```

```
void setChannelB(UBYTE x);
};
```

**EXS API Hex Format**

## Cross Disconnect Span 0x001D

---

**SwitchKit Name** CrossDisconnectSpan

**Type** EXS API and SwitchKit API message

**Description** **Cross Disconnect Span 0x001D**

This message disconnects all data paths of two spans that were previously connected by means of the *Cross Connect Span* message (*XL\_CrossConnectSpan*).

**NOTE:** When cross-connecting channels across nodes in a CSP system, a separate message must be sent to each channel in the connection.

For example, you would send one message to Node 1: *Cross Disconnect Span* (CrossDisconnectSpan) 0,1. You would send another message to Node 2: *Cross Disconnect Span* (CrossDisconnectSpan) 1,0.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
CrossDisconnectSpan (
 Node = integer,
 SpanA = integer,
 SpanB = integer);
```

### C Structure

```
typedef struct {
 unsigned short SpanA;
 unsigned short SpanB;
} XL_CrossDisconnectSpan;
```

### C++ Class

```
class XLC_CrossDisconnectSpan : public
 XLC_OutboundMessage {
public:
 unsigned short getSpanA() const;
 void setSpanA(unsigned short x);
 unsigned short getSpanB() const;
 void setSpanB(unsigned short x);
};
```

**EXS API Hex Format**

**SwitchKit Code**    **Configuration**

In the configuration below you can replace:

```
PriDChannelSpanID = integer,
PriDChannel = integer,
```

with

```
SecondaryDChannelSpanID = integer,
SecondaryDChannel = integer,
```

```
DChannelAssign (
 Node = integer,
 Slot = integer,
 PriDChannelSpanID = integer,
 PriDChannel = integer,
 SecondaryDChannelFacility = integer,
 DChannelType = integer,
```

### C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE SecondaryDChannelFacility;
 UBYTE DChannelType;
 UBYTE Data;
} XL_DChannelAssign;
```

### C++ Class

```
class XLC_DChannelAssign : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSecondaryDChannelFacility() const;
 void setSecondaryDChannelFacility(UBYTE x);
 UBYTE getDChannelType() const;
 void setDChannelType(UBYTE x);
 UBYTE getData() const;
 void setData(UBYTE x);
```

};

**EXS API Hex Format**

**Secondary D Channel Facility**

The table below shows timeslots on an E1 span that map to logical channels in the CSP. You must assign D channels to timeslot 16 (Channel 30 (0x1E) as noted with shading). You cannot use Channels 30 and 31 for voice/data when configured for ISDN applications.

D Channel Assign 0x00C4

| <b>Timeslot</b> | <b>Logical Channel</b> |
|-----------------|------------------------|
| 0               | 31                     |
| 1               | 0                      |

## D Channel De-assign 0x00C5

---

**SwitchKit Name** DChannelDeAssign

**Type** EXS API and SwitchKit API message

**Description** **D Channel De-assign 0x00C5**

This message is used by the host to de-assign an ISDN PRI D channel. The D channel may then be re-assigned using the *D Channel Assign* message. D channel De-assign messages must be sent for each of the D channels (DSOs) making up the Super Rate D channel. The base D channel must be de-assigned before any of the others can be de-assigned.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
DChannelDeassign (
 Node = integer,
 Span = integer,
 Channel = integer);
```

**C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
} XL_DChannelDeAssign;
```

**C++ Class**

```
class XLC_DChannelDeAssign : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

**EXS API Hex Format**

| <b>Description</b>    | <p><b>D Channel Facility List Configure 0x00C6</b></p> <p>This message is used by the host to add or delete spans from the facility list of D channels in NFAS mode. A D channel can control up to 20 spans of NI2 channels and 10 spans for all other channel types. The span where the D channel is assigned is automatically added to the facility list as Facility 0. You do not need to add it to the facility list using this message.</p> |
| <b>Sent by</b>        | Host                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                                                                                                                                              |
| <b>Purpose</b>     | Use the <i>SK_DeviceServerEx</i> message to configure the H.323 IP Signaling Series 3 card.                                                                                                                                        |
| <b>Description</b> | This message is used by the CSA to configure the H.323 IP Signaling Series 3 card. Its configuration syntax corresponds to the message fields of the <i>XL_DeviceServerConfigure</i> and <i>XL_IPCallServerConfigure</i> messages. |
| <b>Sent by</b>     | Host, via CSA configuration or SwitchManager configuration file.                                                                                                                                                                   |

**Arguments** The following table shows the arguments you can change:

| <b>Arguments</b>     | <b>Description</b>                                                                   |

## Diagnostics Indication 0x0045

---

**SwitchKit Name**    DiagnosticsIndication

**Type**            EXS API and SwitchKit API message

**Description**    **Diagnostics Indication 0x0045**

This message sends information to the host about a specific module to help diagnose protocol/system problems. Use the *ISDN Interface Configure* message options bitmask entity for enabling/disabling this message.

### **WARNING**

*This message is for debugging purposes only. It should not be sent during live call processing. Use the ISDN Interface Configure message to enable/disable diagnostics.*

**Sent by**        CSP

**SwitchKit Code**    **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE DiagnosticsType;
 UBYTE Data[222];
} XL_DiagnosticsIndication;
```

### **C++ Class**

```
class XLC_DiagnosticsIndication : public
 XLC_OneChannelMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getDiagnosticsType() const;
 void setDiagnosticsType(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

# Disconnect Tone Pattern 0x001E

---

**SwitchKit Name** DisconnectTonePattern

**Type** EXS API and SwitchKit API message

**Description** **Disconnect Tone Pattern 0x001E**

This message instructs the CSP to terminate call progress tone transmission on the specified channel.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
} XL_DisconnectTonePattern;
```

**C++ Class**

```
class XLC_DisconnectTonePattern : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
};
```

**Timestamp** This field is a long word received Most Significant Byte first, and Least Significant Byte last. It is associated with the newly downloaded system software once it has been validated.

This field is used to determine which matrix has the most recent system software in a redundant system when two different system software versions

are present. In this situation the system software with the highest timestamp will be transferred to the other matrix.

As far as the matrices are concerned, the timestamp has nothing to do with time, but it is suggested that the host use a time-related number in this field. The host must guarantee that each new load has a higher timestamp than the previous one or the new load will be overwritten with the system software from the other matrix. The format of the timestamp is number of seconds since January 1, 1970.

| <b>Description</b>    | <p><b>DS0 Status Change 0x0042</b></p> <p>This message informs the host of the current status of the channel specified. It is sent when the status of a channel has changed. All host applications must be designed to handle this message for out-of-service and in-service conditions.</p> |
| <b>Sent by</b>        | CSP                                                                                                                                                                                                                                                                                          |
| <b>Resent</b>         | This message is resent once after five seconds.                                                                                                                                                                                                                                              |

### SwitchKit Code C Structure

```
typedef struct {
 BaseFields Base;
 UBYTE AddrInfo[30];
 UBYTE ChannelStatus;
 UBYTE PurgeStatus;
} XL_DS0StatusChange;
```

### C++ Class

```
class XLC_DS0StatusChange : public XLC_InboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 XBYTE getStartSpan() const;
 void setStartSpan(XBYTE x);
 UBYTE getStartChannel() const;
 void setStartChannel(UBYTE x);
 XBYTE getEndSpan() const;
 void setEndSpan(XBYTE x);
 UBYTE getEndChannel() const;
 void setEndChannel(UBYTE x);
 XBYTE getSpan() const;
 void setSpan(XBYTE x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getChannelStatus() const;
 void setChannelStatus(UBYTE x);
 UBYTE getPurgeStatus() const;
 void setPurgeStatus(UBYTE x);
};
```

### Tip for C Programmers

To extract the span and channel in the C version of the API, you need to use the following code:

```

CASE_DS0StatusChange(ds0) {
 printf("DS0 Stat Change, Span:%d, Chan:%d, Purge:%X\n",
 sk_getAIBSpan(ds0->AddrInfo),
 sk_getAIBChannel(ds0->AddrInfo),
 ds0->ChannelStatus,
 ds0->PurgeStatus);
 return OK;
}

```

**EXS API Hex Format**

## DS3 Configure/Query 0x000F

---

**SwitchKit Name** DS3GenericMessage

**Type** EXS API and SwitchKit API message

**Description** **DS3 Configure/Query 0x000F**

Use this message to perform the following:

- Configure Loopback Mode
- Query Loopback Mode
- DS3 Framer Configure and Query

**NOTE:** You must take a DS3 (Entity 1) or the DS3 spans (Entity 3) out of service before you can place it into local loop back. The DS3 AIB must always be 0.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
DS3GenericMessage (
 Node = integer,
 Slot = integer,
 DS3 = integer,
 Entity = integer,
 DataLength = integer,
 Data = byte array);
```

**C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE DS3;
 UBYTE Entity;
 UBYTE DataLength;
 UBYTE Data[221];
} XL_DS3GenericMessage;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 UBYTE Slot;
 UBYTE DS3;
 UBYTE Entity;
 UBYTE DataLength;
 UBYTE Data[219];
} XL_DS3GenericMessageAck;
```

**C++ Class**

```

class XLC_DS3GenericMessage : public XLC_OutboundMessage
{
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDS3() const;
 void setDS3(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

**C++ Class Response**

```

class XLC_DS3GenericMessageAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;

# DSP Cache Modify 0x011A

---

**SwitchKit Name** DSPCacheModify

**Type** EXS API and SwitchKit API message

**Description** **DSP Cache Modify 0x011A**

**NOTE:** This message applies to the DSP Series 2 card only.

Use this message to clear either a single file ID (including a file ID for a temporary recording) or all file IDs on the main board cache as well as the cache on all the DSPs. You can also use this message to copy any file residing in cache (playback or recording) to permanent storage on a server.

**Sent by** Host Application

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE reserved18[29];
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[220];
} XL_DSPCacheModify;
```

**C++ Class**

```
class XLC_DSPCacheModify : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const ;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
 void setDataType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

# DSP Service Cancel 0x00BE

---

**SwitchKit Name** DSPServiceCancel

**Type** EXS API and SwitchKit API message

**Description** **DSP Service Cancel 0x00BE**  
Use this message to cancel a DSP Service.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE ServiceType;
 UBYTE reserved48[222];
} XL_DSPServiceCancel;
```

**C++ Class**

```
class XLC_DSPServiceCancel : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getServiceType() const;
 void setServiceType(UBYTE x);
};
```

**EXS API Hex Format**

# DSP Service Request 0x00BD

---

**SwitchKit Name** DSPServiceRequest

**Type** EXS API and SwitchKit API message

**Description** **DSP Service Request 0x00BD**

Use this message to allocate a DSP service on the specified channel. DSP services supported are:

- DTMF Reception
- Energy Detection
- Call Progress Analysis Reception
- Coin Tone Reception (DSP-ONE Only)

After this message is sent the CSP sends the *Call Processing Event* (0x2E) message to report the occurrence of a corresponding Event on the specified channel. However, if the DSP service type is *Call Progress Analysis* (0x03) the CSP answers with a *Call Progress Analysis Result* (0x34) message.

**NOTE:** Ringback is detected on the fourth cycle of ringback/silence.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE ServiceType;
 UBYTE Data[222];
} XL_DSPServiceRequest;
```

**C++ Class**

```
class XLC_DSPServiceRequest : public
 XLC_OneChannelOutbound {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getServiceType() const;
 void setServiceType(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

| : | <p>Data[0 . . . ]</p> <p>The meaning of the <i>Data</i> fields depends on the <i>Service Type</i>. See below.</p> <p>0x01 DTMF Receiver (0x01) and<br/>         0x16 DTMF and Dial Pulse Receiver with Termination of Tone/Announcement<br/>         0x17 Dial Pulse Receiver with Termination of Tone/Announcement<br/>         0x81 DTMF Receiver, Matrix Based RFC 2833 Collection<br/>         0xE1 DTMF Receiver with Termination of Tone/Announcement</p> <p>The DTMF receiver data instructs the CSP to attach a digit receiver to the specified channel and to start collecting digits. The call must be in a state other than idle, out of service, or busied out. The CSP sends Call Processing Event messages with event "digits" for every digit collected. If an error condition occurs, the CSP sends a Call Processing Event message with the "Status" field indicating the error.</p> <p>The host application is responsible for instructing the CSP to release the digit receiver when either the receiver is finished collecting digits or when an error condition occurs. The host accomplishes the release by sending a DSP Service Cancel message. If the call is disconnected, the CSP releases the digit receiver.</p> <p>Data[0,1] Digit Timer<br/>         The maximum amount of time to wait for the digit.<br/>         The following values disable this timer:<br/>         0xFFFF<br/>         0x0000<br/>         0x0001<br/>         0x0002</p> <p>Data[2] Configuration Bits (0 = disabled, 1 = enabled)<br/>         Bit 0 Report the digit at its falling edge (when the first digit is released).<br/>         If the bit is not set the digit will be reported at its rising edge (when the digit is first entered).<br/>         Bit 1 Ignore "#" character as first digit.<br/>         Bit 2 Report digit duration (the amount of time the digit has been pressed).<br/>         Valid only if Configuration Bit Number 0 is 1.<br/>         Bits 3–7 Reserved, must be 0.</p> <p>Data[3,4] Minimum Receive Digit Duration Timer<br/>         Valid timer values: 0x0000–0xFFFE</p> <p>The minimum amount of time for a digit to be present before it is detected and validated.<br/>         If you send the values 0x0000 through 0x0002, the CSP automatically sets the time to 0x0003.</p> <p>Note: The Minimum Receive Digit Duration Timer field is not valid for dial pulse detection.<br/>         For DTMF detection, you may set either the Digit Timer or the Minimum Digit Duration timer to 0xFFFF, but <b>not both</b>. If you set both timers to 0xFFFF, this message cannot detect digits.</p> <p>Data[5] Termination Digit for Playback/Tone Generation<br/>         0xFF Any DTMF termination digit for terminating playback/tone generation</p> <p>Note: Data[5] used with <i>Service Type</i> 0xE1, 0x16 and 0x17</p> |

|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0x02 | <p>Energy Detection</p> <p>Data[0] Sensitivity Level<br/>         The loudness is measured by the energy level present for white noise (constant energy) at a specified dBm level, ranging from 0 dBm (loudest) to -30 dBm (quietest). A sensitivity level of 0 dBm, the least sensitive, would be used in a case where there is a high level of background noise expected. A sensitivity level of -30 dBm, the most sensitive would be used if there is little background noise expected.</p> <p>0x00 0 dBm<br/>         0x01 05 dBm<br/>         0x02 10 dBm<br/>         0x03 15 dBm<br/>         0x04 20 dBm<br/>         0x05 25 dBm<br/>         0x06 30 dBm</p> <p>Data[1] Reporting Mode<br/>         0x01 Report Initial Energy Detection Only<br/>         0x02 Report All Energy Threshold Crossings</p> <p>Data[2,3] Scan Duration<br/>         The scan duration must be expressed in 20 ms increments (10 ms units). For example:<br/>         0x0002 = 20ms<br/>         0x0004 = 40 ms<br/>         0x0006 = 60 ms, etc.</p> <p>Odd increments are rounded down (for example, 0x0003 = 20ms). For more information on energy detection, refer to the <i>API Developer's Guide: Overview</i>.</p> <p>Data[4,5] Completion Timer<br/>         The maximum amount of time to scan for energy. The following values disable this timer:<br/>         0xFFFF<br/>         0x0000<br/>         0x0001<br/>         0x0002</p> |

# DSP SIMM Configure 0x00C0

---

**SwitchKit Name** DSPSIMMConfig

**Type** EXS API and SwitchKit API message

**Description** **DSP SIMM Configure 0x00C0**

Use this message to configure a SIMM on a DSP card. Each SIMM is populated with four DSPs. The host can specify the function to be downloaded to each DSP.

You must take a SIMM out of service before sending this message. After receiving an Acknowledgment to the *DSP SIMM Configure* message, bring the SIMM back in service.

On the DSP-ONE card, each DSP can only handle one function, and four DSPs are configured at the same time.

On the DSP Series 2 card, each DSP can handle multiple functions, so the DSP Chip AIB (0x22) is used to configure individual DSP chips.

**NOTE:** When configuring DSP cards for MFR2 signaling, each card that contains MFR2 receivers must also have MFR2 backward and forward transmitters. If MFR2 Receivers only are present, an incoming call causes an alarm that specifies “DSP Function Not Configured” and the MFR2 receivers are not used.

**Sent by** Host Application

**Example Message (Socket Log Output for SwitchKit)** 00 0F 00 C0 00 00 FF 00 01 12 02 01 01 01 01 01

**SwitchKit Code** **Configuration**

```
DSPSIMMConfig (
 Node = integer,
 Slot = integer,
 SIMM = integer,
 DSPChip = integer,
 DSP0Func = integer,
 DSP1Func = integer,
 DSP2Func = integer,
 DSP3Func = integer);
```

**C Structure**

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE DSP0Func;
 UBYTE DSP1Func;
 UBYTE DSP2Func;
 UBYTE DSP3Func;
```

```
} XL_DSPSIMMConfig;
```

**C++ Class**

```
class XLC_DSPSIMMConfig : public XLC_SlotMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getDSPChip() const;
 void DSPChip(UBYTE x);
 UBYTE getDSPSlot() const;
 void setDSPSlot(UBYTE x);
 UBYTE getDSPSIMM() const;
 void setDSPSIMM(UBYTE x);
 UBYTE getSIMM() const;
 void setSIMM(UBYTE x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDSP0Func() const;
 void setDSP0Func(UBYTE x);
 UBYTE getDSP1Func() const;
 void setDSP1Func(UBYTE x);
 UBYTE getDSP2Func() const;
 void setDSP2Func(UBYTE x);
 UBYTE getDSP3Func() const;
 void setDSP3Func(UBYTE x);
};
```

**EXS API Hex Format**

| :               | Checksum                                                                                                                                           |                 |                       |

**Slot Number** The slot numbers are as follows:  
CSP 2090: 0x00–0x0F - Physical slot number of the DSP card  
CSP 2040: 0x00–0x03 - Physical slot number of the DSP card

**SIMM Number** The SIMM numbers are as follows:  
DSP-ONE Card: 0x00–0x03  
DSP Series 2 Card: 0x00 or 0x01

**Function** On the DSP Series 2 card, each field configures a function on a single chip on a DSP. On the DSP-ONE card, each field configures a function on an entire DSP.

#### **DSP Series 2**

Function 1 = RCV 0  
Function 2 = TXMT 0  
Function 3 = RCV 1  
Function 4 = TXMT 1

#### **DSP-ONE**

Function 1 = DSP 0  
Function 2 = DSP 1  
Function 3 = DSP 2  
Function 4 = DSP 3

**Function Types** 0x00 - No Function Type

#### **Tone Reception**

0x01- DTMF  $\mu$ -law  
0x02 - MFR1  $\mu$ -law  
0x03 - DTMF A-Law

0x1A - Bong Tone  $\mu$ -Law

0x1B - Bong Tone A-Law

## **Fax**

0x32 - Send/Receive Fax

## **File Playback / Record (DSP Series 2 Only)**

0x1D - File Playback / Record

## **Conferencing**

### DSP Series 2

0x21 - Monitor

0x22 - Unified

0x23 - DTMF-Clamped \*

\* This option is for backward compatibility. With the DSP Series 2 card you can create a Unified Conference with DTMF Clamping enabled, which is the recommended method

### DSP-ONE

0x1E - Standard  $\mu$ -Law

0x1F - Standard A-Law

0x20 - Mixed

0x21 - Monitor

0x22 - Unified

0x23 - DTMF-Clamped

NOTE: You cannot configure a VRAS SIMM.

**Miscellaneous**

0x33 - Echo Cancel (DSP Series 2 Only)

0x34 - Positive Voice Detection/Answering Machine Detection (PVD/AMD) (DSP Series 2 Only)

**Frequency Shift Keying**

0x35 - Transmit FSK only (DSP Series 2 Only)

0x36 - Transmit and Receive FSK (DSP Series 2 Only)

**Default Function Types on the DSP Series 2 card**

| Module Number | DSP Number | Rcv 0                       | Txmt 0                      | Rcv 1                       | Txmt 1                      |

**Configuration Options on the DSP Series 2 Card**

The following table shows configuration options for function types on the DSP Series 2 card.

| Rcv 0                               | Txmt 0                   | Rcv 1                               | Txmt 1                   |
|-------------------------------------|--------------------------|-------------------------------------|--------------------------|
| Any Tone Receiver Function          | Universal Tone Generator | Any Tone Receiver Function          | Universal Tone Generator |
| File Record or Playback             | Not allowed (0x00)       | File Record or Playback             | Not allowed (0x00)       |
| T.30 Fax                            | Not allowed (0x00)       | T.30 Fax                            | Not allowed (0x00)       |
| Echo Cancel                         | Not allowed (0x00)       | Echo Cancel                         | Not allowed (0x00)       |
| Any of the Valid Conferencing Types | Not allowed (0x00)       | Any of the Valid Conferencing Types | Not allowed (0x00)       |

**Configuration FSK Options on the DSP Series 2 Card**

The following table shows configuration options for the FSK function types on the DSP Series 2 card.

| Rcv 0                           | Txmt 0                   | Rcv 1                           | Txmt 1                   |
|---------------------------------|--------------------------|---------------------------------|--------------------------|
| Any Tone Receiver Function      | Transmit FSK Only (0x35) | Any Tone Receiver Function      | Transmit FSK Only (0x35) |
| Transmit and Receive FSK (0x36) | Not allowed (0x00)       | Transmit and Receive FSK (0x36) | Not allowed (0x00)       |

**Default Function Types on the DSP-ONE Card**

# DynamicConfig

---

|                    |                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | EXS SwitchKit API message                                                                                                                                                                                                                                                               |
| <b>Purpose</b>     | Use the <i>SK_DynamicConfig</i> message to dynamically update the CSP configuration without restarting the SwitchManager. This message includes an argument, ConfigMode, which determines whether the specified file content will be saved by SwitchManager for future reconfiguration. |
| <b>Description</b> | When SwitchManager receives a DynamicConfig message, it will send the configuration referenced in the message to the CSP immediately. Those messages are maintained on the CSP. The filename must be relative to the SwitchManager process.                                             |
| <b>Sent by</b>     | Converged Services Administrator or Application                                                                                                                                                                                                                                         |
| <b>Arguments</b>   | The following table shows the user modifiable arguments for this message:                                                                                                                                                                                                               |

| Argument   | Description                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ConfigMode | This enables or disables writing the content of the specified file into the current configuration file used by Switch Manager. The options are:<br><br>SK_CONFIGSWITCH_APPEND - 0x00<br>SK_CONFIGSWITCH_REPLACE - 0x01<br>SK_CONFIGSWITCH_REPLACE_AND_SEND - 0x02<br>SK_CONFIGSWITCH_APPEND_NOSEND - 0x03<br>SK_CONFIGSWITCH_SEND_NOAPPEND - 0x04 |
| Filename   | The filename of the file containing the configuration information to parse and send. Location should be relative to SwitchManagers installation directory.                                                                                                                                                                                        |

**C Structure**

```
typedef struct {
 UBYTE ConfigMode;
 char Filename[230];
} SK_DynamicConfig;
```

**C Structure Response**

```
typedef struct {
 int Status;
} SK_DynamicConfigAck;
```

**C++ Class**

```
class SKC_DynamicConfig : public SKC_ToolkitMessage {
```

```

 void setFilename(const char *x);
};
```

**C++ Class Response**

```
class SKC_DynamicConfigAck : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
 const UBYTE *getReserved() const;
 UBYTE *getReserved();
 void setReserved(UBYTE *x);
};
```

## E1 Span Configure 0x00D8

---

**SwitchKit Name** E1SpanConfig

**Type** EXS API and SwitchKit API message

**Description** **E1 Span Configure 0x00D8**

This message allows the host to configure the transmission format, line length, and SA bits of an E1 span.

**NOTE:** Before changing span configuration, Dialogic ALWAYS RECOMMENDS that you de-assign the spans, assign them again and then send the new span configuration.

**Sent by** Host

**Example Message**

The following sample message configures an E1 span with the default coding method, signaling method, E1 Layer I management. CRC-4 and FEBE error checking are configured. The default line length, SA Registers, and TS 16 Register are also configured.

```
00 0F 00 D8 00 FF FF 00 01 0C 02 01 23 E8 00 F8 D0
```

**SwitchKit Code** **Configuration**

```
E1SpanConfig (
 Node = integer,
 Span = integer,
 Format = integer,
 LineLength = integer,
 SARegisters = integer,
 TS16Registers = integer);
```

**C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Format;
 UBYTE LineLength;
 UBYTE SARegisters;
 UBYTE TS16Registers;
} XL_E1SpanConfig;
```

**C++ Class**

```
class XLC_E1SpanConfig : public XLC_SpanMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getFormat() const;
 void setFormat(UBYTE x);
 UBYTE getLineLength() const;
```

```

void setLineLength(UBYTE x);
UBYTE getSARegisters() const;
void setSARegisters(UBYTE x);
UBYTE getTS16Registers() const;
void setTS16Registers(UBYTE x);
};

```

**EXS API Hex Format**

## NOTES

1. To configure a single node for greater than 64 spans, please contact Dialogic technical support.
2. Note that the Dialogic message bit-numbering format is 0–7, while the SA Register and TS 16 Register formats are 1–8. Therefore, bit 3 of the host message format is bit 4 of the SA Register and TS 16 Register formats, and so on.
3. This message is backward-compatible to previous software releases.
4. Refer to ITU-T Recommendation G.704 more details on programming SA bits and spare timeslot 16 bits.
5. To use Euro-ISDN Layer 1, you must use an SE1LC Rev. B11 or greater. For more information, refer to the appropriate *“Hardware Product Descriptions.”*
6. For Euro-ISDN compliant E1, set the following:
  - (Bit 0 = 1) Line format to HDB3
  - (Bit 1 = 1) CRC
  - (Bit 2 = 1) FEBE
  - (Bit 3 = 1) E1 clear Channel
  - (Bit 5 = 1) Euro-ISDN Layer I
  - Line length to G.703
7. For Austel-ISDN compliant E1, set the following:
  - (Bit 0 = 1) Line format to HDB3
  - (Bit 1 = 1) CRC
  - (Bit 2 = 1) FEBE
  - (Bit 3 = 1) E1 clear Channel
  - (Bit 6 = 1) Austel-ISDN Layer I
  - Line length to G.703

**Default E1 Format**

The table below shows the default format for E1 spans. You must enable Clear Channel signaling to use timeslot 16 (Channel 30) as a voice channel or for out-of-band signaling (for example, an ISDN application).

**NOTE:** Clear Channel signaling must be enabled to use timeslot 16 (channel 30) as a D channel in ISDN applications.

| Timeslot | Channel | Description                  |
|----------|---------|------------------------------|
| 0        | 31      | Alarms and framing           |
| 1        | 0       | Voice channels               |
| 2        | 1       |                              |
| 3        | 2       |                              |
| 4        | 3       |                              |
| 5        | 4       |                              |
| 6        | 5       |                              |

## E1 Span Query 0x00DB

---

**SwitchKit Name** E1SpanFormatQuery

**Type** EXS API and SwitchKit API message

**Description** **E1 Span Query 0x00DB**

Use this message to retrieve the transmission format and line length of an E1 span.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
} XL_E1SpanFormatQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Span;
 UBYTE Format;
 UBYTE LineLength;
 UBYTE Slot;
 UBYTE Offset;
 UBYTE SRegisters;
 UBYTE TS16Register;
} XL_E1SpanFormatQueryAck;
```

### C++ Class

```
class XLC_E1SpanFormatQuery : public XLC_OutboundMessage
{
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
};
```

### C++ Class Response

```
class XLC_E1SpanFormatQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getFormat() const;
 void setFormat(UBYTE x);
 UBYTE getLineLength() const;
 void setLineLength(UBYTE x);
```

```

UBYTE getSlot() const;
void setSlot(UBYTE x);
UBYTE getOffset() const;
void setOffset(UBYTE x);
UBYTE getSARegisters() const;
void setSARegisters(UBYTE x);
UBYTE getTS16Register() const;
void setTS16Register(UBYTE x);
};

```

**EXS API Hex Format**

| MESSAGE (White)                                                                                                                                                              |                                                                                                                                        | RESPONSE (Gray) |                               |

### NOTES

1. The Dialogic message bit-numbering format is 0–7, while the SA Register and TS 16 Register formats are 1–8. Therefore, bit 3 of the host message format is bit 4 of the SA Register and TS 16 Register formats, and so on.
2. This message is backward-compatible to previous software releases. If using a System Software 3.X Version 3.09 or earlier, the SA Register and TS 16 Register bits will be set to the default (1), and an *E1 Span Query* message will return a value of 0xF8 for the SA Register byte and 0xD0 for the TS 16 Register byte.

# EXNET Ring Configure 0x0074

## SwitchKit Code Configuration

```
RingConfig (
 Node = integer,
 Slot = integer,
 Ring = integer,
 Entity = integer,
 Data = byte array);
```

## C Structure

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE Entity;
 UBYTE Data[222];
} XL_RingConfig;
```

## C++ Class

```
class XLC_RingConfig : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

| MESSAGE (White) |                            | RESPONSE (Gray) |                       |

0x01 Assign Ring

Data[0] Logical Ring ID

De-assigning an EXNET Ring

Use the values below to de-assign a specific ring or all rings on a node:

0x02 Configure Transmit Mode

Data[0] Transmit Mode

0x00 Receive Only

0x01 Transmit and Receive

0x03 Configure Number of Packets

Data[0] Number of Packets

0x01 - No longer used.

0x03 - No longer used.

0x04 - Four packets (E1, J1, VDAC-ONE, IP Network Interface Series 2, and PCI H.100 EXNET Connect nodes).

0x04 EXNET-ONE Card Diagnostics

Data[0] EXNET-ONE Card Diagnostics

0x00 Reserved

0x01 Non-Forced\*, Internal Loop Back

0x02 Non-Forced\*, External\*\* Loop Back

0x03 Forced, Internal Loop Back

0x04 Forced, External\*\* Loop Back

\*The Non-Forced mode is used to prevent execution of EXNET-ONE Card Diagnostics procedure while EXNET® Ring is up and running. Performing EXNET-ONE Card Diagnostics will take the EXNET® Ring out of service.

\*\*The External Loop Back mode can be used when both I/O ports are externally looped back with fiber optic cabling.

0x05 Prepare For Addition

There is no data associated with this entity.

0x06 Expand Ring

There is no data associated with this entity.

0x07 Loop Back Port

Node ID of the neighbor CSP node. This message must be sent to the node that will loopback its "A" port. The neighbor node will automatically loopback "B" port.

Data[0] 0x00 Logical Node ID of node whose "B" port will be looped back.

0x08 Add Node

There is no data associated with this entity.

| <b>Description</b>    | <b>EXS Node Configuration Query 0x007E</b><br>Use this message to query various configuration entities in a node. |
| <b>Sent by</b>        | Host                                                                                                              |
| <b>SwitchKit Code</b> | <b>C Structure</b>                                                                                                |

```
typedef struct {
 unsigned short Entity;
 UBYTE DataLen;
 UBYTE Data[250];
} XL_NodeConfigQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 unsigned short Entity;
 UBYTE DataLength;
 UBYTE Data[248];
} XL_NodeConfigQueryAck;
```

### C++ Class

```
class XLC_NodeConfigQuery : public XLC_OutboundMessage {
public:
 unsigned short getEntity() const;
 void setEntity(unsigned short x);
 UBYTE getDataLen() const;
 void setDataLen(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### C++ Class Response

```
class XLC_NodeConfigQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 unsigned short getEntity() const;
 void setEntity(unsigned short x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
```

};

0x04 Clock Master

Data[0] Slot Number

Data[1] Configured Bus Master

- 0x00 PCI H.100 EXNET Connect is configured to be slave to clock A of H.100 local bus.
- 0x01 H.100 primary clock master driving clock A PCI H.100 EXNET Connect is configured to be H.100 local bus master driving clock A.
- 0x02 H.100 secondary clock master driving clock. This is clock A.
- 0x03 H.100 slave to clock B
- 0x04 H.100 primary clock master driving clock B
- 0x05 H.100 secondary clock master driving clock B

Data[2] Configured Speed

- 0x00 4 MHz [SCSA compatibility mode] EXNET Connects are configured at this bus speed. Lower 16 data lines of H.100 bus are configured at this bus speed.
- 0x02 8 MHz [Full H.100 mode] All 32 data lines of H.100 bus are configured at this bus speed.

Data[3] Actual Bus Master

- 0x00 H.100 Slave to clock A. EXNET Connect actual state is not as local bus master. PCI H.100 EXNET Connect actual state is slave to clock A of H.100 local bus.
- 0x01 H.100 primary clock master driving clock. A PCI H.100 EXNET Connect actual state is H.100 local bus master driving clock A.
- 0x02 H.100 secondary clock master driving clock A
- 0x03 H.100 slave to clock B
- 0x04 H.100 primary clock master driving clock B
- 0x05 H.100 secondary clock master driving clock B
- 0x06 H.100 bus not available

Data[4] Actual Speed

- 0x00 4 MHz [SCSA compatibility mode] EXNET Connects are at this bus speed. Lower 16 data lines of H.100 bus are at this bus speed.
- 0x02 8 MHz [Full H.100 mode] All 32 data lines of H.100 bus are at this bus speed.

EXS Node Configuration Query 0x007E

## Fault Log Query 0x0086

---

**SwitchKit Name** FaultLogQuery

**Type** EXS API and SwitchKit API message

**Description** **Fault Log Query 0x0086**

This message should be sent by the host if it receives a *Card Status Report* message or a response to a *Card Status Query* message with the “Faults Logged” bit set. Faults are queried for the slot specified. The host receives separate responses for each fault logged. There are two types of logs: a fault log containing a log that can be cleared after it is reported by setting the Action field to 0x02. The response data should be reported to Dialogic Technical Support for evaluation.

The host can also send this message to the active or standby CSP 2000 Matrix Card.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE Action;
} XL_FaultLogQuery;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 UBYTE AddrInfo[30];
 UBYTE NumFaults;
 UBYTE FaultNumber;
 char FaultBuffer[80];
} XL_FaultLogQueryAck;
```

**C++ Class**

```
class XL_C_FaultLogQuery : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getModule() const;
 void setModule(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
};
```

### C++ Class Response

```
class XLC_FaultLogQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getModule() const;
 void setModule(UBYTE x);
 UBYTE getNumFaults() const;
 void setNumFaults(UBYTE x);
 UBYTE getFaultNumber() const;
 void setFaultNumber(UBYTE x);
 const char *getFaultBuffer() const;
 void setFaultBuffer(const char *x);
};
```

### EXS API Hex Format

| MESSAGE (White) |                                                                                                                         | RESPONSE (Gray) |                                                                                                                                                                                                                                                                                                   |

**NOTES:**

1. Faults are logged as NULL terminated readable text strings. The host will receive a message for each fault in the log.
2. When in any state other than active, the only valid slot is the matrix that the message is sent to. All requests for other slots will receive a response status of negative acknowledgment.

# Filter/Timer Configure 0x0012

---

**SwitchKit Name** FilterTimerConfig

**Type** EXS API and SwitchKit API message

**Description** **Filter/Timer Configure 0x0012**

This message is used to adjust trunk and line signaling filters and timers. Typically, it is only required when the trunk or line that the CSP is connected to is not operating to line interface specifications.

All timers and filters are set to default values based on industry specifications when the channel trunk type is configured. To query the timers and filters use the *Channel Parameter Query* message.

**NOTE:** Use this message to configure the PPL timers for all STILC line cards. You cannot use the *PPL Timer Configure* message with the STILC line cards.

**Sent by** Host

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

**SwitchKit Code** **Configuration**

```
FilterTimerConfig (
 Node = integer,
 Range = StartSpan:StartChan - EndSpan:EndChan,
 Type = integer,
 FilterID = integer,
 Value = integer);
```

**C Structure**

```
typedef struct {
 unsigned short StartSpan;
 UBYTE StartChannel;
 unsigned short EndSpan;
 UBYTE EndChannel;
 UBYTE Type;
 UBYTE FilterID;
 unsigned short Value;
} XL_FilterTimerConfig;
```

**C++ Class**

```
class XLC_FilterTimerConfig : public XLC_ChanRangeMessage
{
public:
 unsigned short getStartSpan() const;
 void setStartSpan(unsigned short x);
 UBYTE getStartChannel() const;
```

```

void setStartChannel(UBYTE x);
unsigned short getEndSpan() const;
void setEndSpan(unsigned short x);
UBYTE getEndChannel() const;
void setEndChannel(UBYTE x);
UBYTE getType() const;
void setType(UBYTE x);
UBYTE getFilterID() const;
void setFilterID(UBYTE x);
unsigned short getValue() const;
void setValue(unsigned short x);
};

```

# ForceGroupState

---

**Type** EXS SwitchKit API message

**Purpose** This message causes the LLC to take action on all of the channels within the group specified by the ChannelGroup field. This will only affect channels not currently owned or watched by another application.

**Sent by** SwitchKit Application

**Arguments** The following table shows the arguments you can change:

| Argument     | Description                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ChannelGroup | The name of the group this action should be performed on.                                                                                           |
| action       | The state the LLC is requesting this channel be put into. Values for ForceGroupState actions:<br><br>SK_OUT_OF_SERVICE =0x0F<br>SK_IN_SERVICE =0xF0 |
| int status   | This is a response argument. The values are:<br><br>SK_INVALID_GROUP - No valid channel group was found.<br>OK - Success                            |

## Response Arguments

| Argument     | Description                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------|
| ChannelGroup | The name of the group this action should be performed on.                                                     |
| int status   | The values for this argument are:<br><br>SK_INVALID_GROUP - No valid channel group was found.<br>OK - Success |

**C Structure**      typedef struct {

# Generic Card Configure 0x0122

---

**SwitchKit Name** GenericCardConfigure

**Type** EXS API and SwitchKit API message

**Description** **Generic Card Configure 0x0122**

Use this message for a variety of card configuration options.

## DSP Series 2 Card

For the DSP Series 2 card, use this message to configure the following:

- Card-level Defaults
- Alarms
- NFS location and Vocabulary Index File
- Sequence Number Size (8-bit or 16-bit)
- Advanced Conferencing Features
- T.30 Fax Parameters
- Positive Voice Detection/Answering Machine Detection
- Echo Cancellation Parameters
- Dial Pulse Detection Parameters

**Sent by** Host Application

**Related API Message** *Generic Card Query*

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE reserved18[29];
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_GenericCardConfigure;
```

## C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE reserved6[13];
 UBYTE TLVCount;
 UBYTE Data[250];
} XL_GenericCardConfigure;
```

### **C++ Class**

```
class XLC_GenericCardConfigure : public
 XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
 void setDataType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### **C++ Class Response**

```
class XLC_GenericCardConfigureAck : public
 XLC_OutboundMessage {
public:
 unsigned short getStatus() const
 void setStatus(unsigned short x)
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x)
 ;
```

## Generic Card Query 0x0123

---

**SwitchKit Name** GenericCardQuery

**Type** EXS API and SwitchKit API message

**Description** **Generic Card Query 0x0123**

Use this message to query various card configuration settings.

**NOTE:** If you send too many TLVs in one message and exceed the allowable message length, you receive a Memory Allocation Failure NACK.

### DSP Series 2 Card

For the DSP Series 2 card, use this message to query the following:

- Card-level Defaults
- Alarm settings
- NFS location and Vocabulary Index File
- Sequence Number Size (8-bit or 16-bit)
- Advanced Conferencing Features
- T.30 Fax Parameters
- Echo Cancel Parameters
- Dial Pulse Detection Parameters

**Sent by** Host Application

**Related API Message** *Generic Card Configure*

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE reserved18[29];
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_GenericCardQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE reserved6[13];
 UBYTE TLVCount;
 UBYTE Data[250];
} XL_GenericCardQueryAck;
```

### C++ Class

```
class XLC_GenericCardQuery : public XLC_OutboundMessage {
public:
```

```

UBYTE getSlot() const;
void setSlot(UBYTE x);
UBYTE getDataType() const;
void setDataType(UBYTE x);
UBYTE getTLVCount() const;
void setTLVCount(UBYTE x);
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x)
};

```

### C++ Class Response

```

class XLC_GenericCardQueryAck : public
 XLC_OutboundMessage {
public:

 unsigned short getStatus() const
 void setStatus(unsigned short x)
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x)
 ;

```

### EXS API Hex Format

## Generic Event Logger Configure/Query 0x003D

---

**SwitchKit Name** GELConfigQuery

**Type** EXS API and SwitchKit API message

**Description** **Generic Event Logger Configure/Query 0x003D**

The Generic Event Logger (GEL) records system application and software debug events in the CSP. The GEL provides more debug data than the current fault log and online diagnostics.

This message lets you control the Generic Event Logger (GEL). Every card that supports GEL has two buffers. One buffer stores LOGF/LOGB entries, and the other stores LOGT entries.

LOGF enters seven data fields of ULONG type and an 80 character descriptor field to the LOGF/LOGB buffer. All data fields are user defined.

LOGB puts a memory dump from a user defined address into the LOGF/LOGB buffer. The user also defines the size of the memory dump and a descriptive string of up to 20 characters.

LOGT places a user-defined 20 character descriptive string into the LOGT buffer.

**NOTE:** This message is for debugging purposes only and should not be used until you contact technical support. Also, this message reduces system performance. **Dialogic recommends using this message in test systems only.**

**Sent by** Host

**SwitchKit Code** **Configuration**

```
GELConfigQuery (
 Node = integer,
 Slot = integer,
 Action = integer,
 DataLength = integer,
 Data = byte array);
```

**C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE Action;
 UBYTE DataLength;
 UBYTE Data[221];
} XL_GELConfigQuery;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 UBYTE Slot;
```

```
 UBYTE Data[221];
} XL_GELConfigQueryAck;
```

### **C++ Class**

```
class XLC_GELConfigQuery : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getAction() const;
 void setAction(UBYTE x);
 UBYTE getDataLength() const;
 void setDataLength(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

### **C++ Class Response**

```
class XLC_GELConfigQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**EXS API Hex Format**

**Response Status Continued Below**

If the message contains invalid fields, the CSP returns a NACK, but the following are some specific reasons for NACKs to this message. If you try to configure the logger or retrieve the buffer before pausing the logger, then the CSP responds with a NACK. This NACK specifies that the logger is not in a valid state.

The following NACKs are used:

- 0x14 Message Invalid for Current CSP 2000 Matrix Card State  
The CSP Matrix Series 3 Card is not in a state to accept this message.
- 0x74 Invalid Card Type  
Incorrect card type for attempted operation.
- 0x20 Invalid Action Value  
Invalid decision parameter action value was received.
- 0x61 Invalid Slot  
The slot specified is not valid for the message sent.
- 0x99 Invalid Configuration Request  
Configuration request is invalid.
- 0x17 Invalid Data Type  
Returned in response to a message with invalid data parameters.

# Generic Report 0x0046

---

**SwitchKit Name** GenericReport

**Type** EXS API and SwitchKit API message

**Description** **Generic Report 0x0046**

This message is generated in response to the following Query Types sent in the *System Configuration Query* message:

- 0x04 - Active Conference IDs
- 0x05 - Channel State
- 0x08 - DS1 Trunk MIB Report
- 0x0A - Resource Usage
- 0x0B - DS3 Trunk MIB Report
- 0x10 - Detailed Conference Information
- 0x13 - Conference Speakers
- 0x14 - Conferencing Features
- 0x15 - Child Conference Information
- 0x16 - Child Conference IDs
- 0x18 - Cache File Query

**NOTE:** The AIB and Number of Resources fields apply only if the Report Type field is Resource Usage (0x0A)

**In SwitchKit**

If you want to get this report, you must register for it by calling the `sk_msgRegister` function with the parameter, `SK_RESOURCE_UTIL_REPORT`.

**Sent by** CSP

**Example Message (Socket Log Output for SwitchKit)**

In the following socket log output/example message, the *Generic Report* contains resource usage data for Slot 9.

```
00 63 00 46 00 00 ff 0a 00 01 01 01 09 04 00 26 03 01 02 00
02 48 c0 00 00 01 c0 03 00 02 63 00 00 00 00 05 00
05 9e 00 00 03 26 00 05 00 08 8c 00 00 00 04 00 01 01
00 02 08 00 00 f4 84 01 00 5c 05 03 20 00 00 f4 84 09
00 5c 05 01 00 11 02 00 05 03 00 0f 04 01 30 05 00 34
06 00 47 07 00 26 32 04 3d
```

**Switchkit Code C Structure**

```
typedef struct {
 UBYTE ReportType;
 UBYTE Data[252];
} XL_GenericReport;
```

**C++ Class**

```
class XLC_GenericReport : public XLC_InboundMessage {
public:
 UBYTE getReportType() const;
 void setReportType(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message** The following table provides an overview of this message. The table following it provides the detail for each byte.

0x05 Channel State

Data 0–6 is an AIB indicating the first channel to be reported:

- Data[0] Address Method (0x00) Individual AEs
- Data[1] Number of Address Elements (0x01)
- Data[2] Address Type (0x0D, Channel)
- Data[3] Data Length (0x03)
- Data[4] Logical Span ID, MSB
- Data[5] Logical Span ID, LSB
- Data[6] Channel

Data[7] Number of channels reported (1-32)

Data[8] First channel's current L4 state. (Repeated for each channel.)

The following are Layer 4 state values:

- 0x00 Out-of-Service
- 0x01 Incoming Call
- 0x02 Wait For CSA in Incoming Call State
- 0x03 In Service Idle
- 0x04 Incoming Call, Wait for L5
- 0x05 Outgoing Call, L3 Outseize Wait
- 0x06 Wait For CSA in Incoming Call Wait for Host State
- 0x07 Answered
- 0x08 L4 Clear ACK Wait, L3 Disconnect Received
- 0x09 L3 Clear Wait
- 0x0A Busied out
- 0x0B Outgoing Call Cut-thru
- 0x0C Wait for CSA in Incoming Alerted State
- 0x0D Wait for CSA in Incoming in Answered State
- 0x0E Incoming Call Alerted
- 0x0F L3 Clear Wait
- 0x10 Wait for CSA in Outgoing Cut-thru
- 0x11 Wait for CSA in Outgoing Alerted State
- 0x12 L4 Clear ACK Wait, L3 Clear Received
- 0x13 Outgoing Call Alerted
- 0x14 L4 Clear ACK Wait, L5 Clear Received
- 0x15 L5 Release Wait
- 0x16 Incoming Call, L4 Clear ACK Wait (Park Processing)
- 0x17 Incoming Call Alerted, L4 Clear ACK Wait (Park Processing)
- 0x18 Answered, L4 Clear ACK Wait (Park Processing)
- 0x19 Outgoing Alerted, L4 Clear ACK Wait (Park Processing)
- 0x1A Outgoing Cut-thru, L4 Clear ACK Wait (Park Processing)
- 0x1B Wait for CSA (Call Service Ack) for Internal Routing

Data[9] First channel's current L3 state as viewed by L4  
(Repeated for each channel.)

The following are the Layer 3 state values relevant to Layer 4:

- 0x00 Out-of-Service
- 0x01 In Service
- 0x02 Maintenance
- 0x03 In Service Blocked
- 0x04 Unblocked

0x08 - DS1 Trunk MIB Report

Data 0-5 is an AIB:

- Data[0] Address Method (0x00)
- Data[1] Number of Address Elements (0x01)
- Data[2] Address Type (0x0C)
- Data[3] Data Length (0x02)
- Data[4-5] Logical Span
- Data [6-9] Errored seconds
- Data [10-13] Severly errored seconds
- Data [14-17] Severly errored framing seconds
- Data [18-21] Unavailable seconds
- Data [22-25] Controlled slip seconds
- Data [26-29] Path code violations
- Data [30-33] Line code violations
- Data [34-37] Line errored seconds
- Data [38-41] Bursty errored seconds
- Data [42-45] Degraded minutes
- Data [46-49] Time elapsed
- Data [50-53] Interval number

0x0A Resource Usage

Resource ID 0x00 Memory

- Data[0] Length
- Data[1] Number of regions configured on the card
- Data[2] Number of partitions configured on the card
- Data[3] Region ID of Nth region
- Data[4-7] Size of the region in bytes
- Data[8-11] Number of bytes used from the region
- Data [12] Partition ID of Nth partition
- Data[13-16] Size of the partition in bytes
- Data[17-20] Used bytes of partition
- :
- Data[:] Region ID of Nth region(1 byte)
- Data[:] Size of the Nth region in bytes (4 bytes)
- Data[:] Number of bytes used from the Nth region(4 bytes)
- Data [:] Partition ID of 1st partition (1 byte)
- Data[:] Size of the 1st partition in bytes (4 bytes)
- Data[:] Used bytes of 1st partition (4 bytes)
- :
- Data [:] Partition ID of Nth partition (1 byte)
- Data[:] Size of the Nth partition in bytes (4 bytes)
- Data[:] Used bytes of Nth partition (4 bytes)

Resource ID 0x01 MCB

- Data[0] Length
- Data[0] Message buffer usage

Resource ID 0x02 CPU Usage Level 1

- Data[0] Length
- Data[1-4] Time in milliseconds covering this report
- Data[5] Number of tasks reported
- Data[6] Logical task ID (idle task only 0x00)
- Data[7] Percentage of time usage for task (integer part)
- Data[8] Percentage of time usage for task (decimal part)

0x13 Conference Speakers (Child Conference)

If conference speaker information is queried for child conference, the report data will be in the following format.

Data[0-7] Child Conference ID AIB  
Data[8-9] Speaker #1 Span  
Data[10] Speaker #1 Chan  
Data[11] Speaker #1 Energy Level (dBm)  
Data[12-15] Speaker #1 Active Speaking Time  
Data[16-17] Speaker #2 Span  
Data[18] Speaker #2 Chan  
Data[19] Speaker #1 Energy Level (dBm)  
Data[20-23] Speaker #2 Active Speaking Time  
Data[24-25] Speaker #3 Span  
Data[26] Speaker #3 Chan  
Data[27] Speaker #1 Energy Level (dBm)  
Data[28-31] Speaker #3 Active Speaking Time

0x14 Conferencing Features (Parent Conference)

If a conference ID is queried, the Report data is in the following format:

Data[0-5] Conference ID AIB  
Data[6-7] DTMF Clamping Enabled  
Data[8-9] Output Gain  
Data[10-11] Noise Gating Enabled  
Data[12-13] Noise Gating Time Constant  
Data[14-15] Max Noise Level  
Data[16-17] Noise Gating Sensitivity  
Data[18-19] Echo Suppression Enable  
Data[20-21] Echo Return Loss  
Data[22-23] AGC Enable  
Data[24-25] AGC Input Level  
Data[26-27] AGC Time Constant  
Data[28-29] Conference Failure Behavior  
Data[30-31] Input Gain  
Data [32-33] Transit Connection Mode

If a channel is queried the Report data is in the following format:

Data[0-6] Channel AIB  
Data[7-8] DTMF Clamping Enabled  
Data[9-10] Output Gain  
Data[11-12] Noise Gating Enabled  
Data[13-14] Noise Gating Time Constant  
Data[15-16] Max Noise Level  
Data[17-18] Noise Gating Sensitivity  
Data[19-20] Echo Suppression Enable  
Data[21-22] Echo Return Loss  
Data[23-24] AGC Enable  
Data[25-26] AGC Input Level  
Data[27-28] AGC Time Constant  
Data[29-30] Conference Failure Behavior  
Data[31-32] Channel Input Gain

0x14 Conferencing Features (Child Conference)

If parameters are queried for child conference, the report data will be in the following format.

Data[0-7] Child Conference ID AIB  
Data[8-9] DTMF Clamping Enabled  
Data[10-11] Output Gain  
Data[12-13] Noise Gating Enabled  
Data[14-15] Noise Gating Time Constant  
Data[16-17] Max Noise Level  
Data[18-19] Noise Gating Sensitivity  
Data[20-21] Echo Suppression Enable  
Data[22-23] Echo Return Loss  
Data[24-25] AGC Enable  
Data[26-27] AGC Input Level  
Data[28-29] AGC Time Constant  
Data[30-31] Conference Failure Behavior  
Data [32-33] Input Gain  
Data [34-35] Transit Connection Mode

If parameters are queried for a particular channel connected to a conference/child conference, the report data will be in the following format.

Data[0-6] Channel AIB  
Data[7-8] DTMF Clamping Enabled  
Data[9-10] Output Gain  
Data[11-12] Noise Gating Enabled  
Data[13-14] Noise Gating Time Constant  
Data[15-16] Max Noise Level  
Data[17-18] Noise Gating Sensitivity  
Data[19-20] Echo Suppression Enable  
Data[21-22] Echo Return Loss  
Data[23-24] AGC Enable  
Data[25-26] AGC Input Level  
Data[27-28] AGC Time Constant  
Data[29-30] Conference Failure Behavior  
Data[31-32] Channel Input Gain

| 0x15 Detailed Child Conference Information |                                  |
|--------------------------------------------|----------------------------------|
| Data[0-1]                                  | Parent Conference ID             |

# GenericLLCReport

---

- Type** SwitchKit API message
- Description** This message reports the status of LLC entities to applications that have registered for it. In particular it will report the status of the LLC socket connections, LLC to LLC redundancy status, and the service state of channels groups being watched by an application.
- Sent by** LLC to applications that have registered for it using the SK\_msgRegister() function with the parameter SK\_GENERIC\_LLC\_REPORT.
- C Structure**
- ```
typedef struct {
    unsigned short DataSize;
    UBYTE ReportType;
    UBYTE TLVCount;
    UBYTE Data[249];
} SK_GenericLLCReport;
```
- C++ Class**
- ```
class SKC_GenericLLCReport : public SKC_ToolkitMessage
{
public:
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 UBYTE getReportType() const;
 void setReportType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```
- Arguments** The following table shows the arguments sent by the LLC:

| Argument   | Description                  |
|------------|------------------------------|
| DataSize   | Number of bytes of the data. |
| ReportType | Type of GenericLLCReport     |
| TLVCount   | Number of TLVs in the data.  |
| data       | Data bytes                   |

## Report Types

The following report types are used in the *GenericLLCReport* message.

| Report Type             | Value                     |
|-------------------------|---------------------------|
| SK_NSR_CHANGE           | 0x01 (not currently used) |
| SK_NSQ_CHANGE           | 0x02 (not currently used) |
| SK_PM_CHANGE            | 0x03                      |
| SK_SOCKET_CHANGE        | 0x04 (not currently used) |
| SK_SSC_UPDATE           | 0x05                      |
| SK_LINK_UP              | 0x06                      |
| SK_LINK_DOWN            | 0x07                      |
| SK_GROUP_WATCHER_STATUS | 0x08                      |
| SK_CHANNEL_RANGE_STATUS | 0x09                      |
| SK_LLC_REDUNDANCY       | 0x0b                      |

**TLVs** Several different TLVs can be reported within the *GenericLLCReport*:

- SK\_LLCREDSTATE\_TLV (0x0004)
- SK\_LLCREDSTATE\_TLV (0x0005)
- SK\_LLCREDSETTINGS\_TLV (0x0006)
- SK\_POLL\_DATA\_TLV (0x1000)
- Sk\_IPV4\_TLV (0x1001)
- SK\_ROUTING\_TLV (0x1002)
- Sk\_LNI\_TLV (0x1003)
- SK\_CHANNEL\_GROUP\_TLV (0x1004)
- SK\_CHANNEL\_RANGE\_TLV (0x1005)

### Report Type: SK\_LLC\_REDUNDANCY

A GenericLLCReport of report type, SK\_LLC\_REDUNDANCY is generated and sent to registered applications by the active LLC when:

- An application connects
- The LLC changes redundancy states
- An *LLCQuery* of type SK\_LLC\_REDUNDANCY\_QUERY\_TLV is sent to the active LLC.

The standby LLC sends reports under the same circumstances. However, because only the active LLC can communicate with the

standby LLC, the primary LLC (PLLC) to redundant LLC (RLLC) link must be in SK\_LINK\_UP state for the application to receive the reports. If the PLLC to RLLC link is in state SK\_LINK\_DOWN, no responses from the standby LLC will be seen.

### Possible TLV Combinations

| Report Type       | LLCREDTYPE_TLV | LLCREDSTATE_TLV | LLCREDSETTINGS_TLV |
|-------------------|----------------|-----------------|--------------------|
| SK_LLC_Redundancy | 1              | 1               | 1                  |

**TLV Syntax** The TLVs described in this section are used with the SK\_LLC\_REDUNDANCY report type in a *GenericLLCReport* message.

- SK\_LLCREDTYPE\_TLV (0x0004)
- SK\_LLCREDSTATE\_TLV (0x0005)
- SK\_LLCREDSETTINGS\_TLV (0x0006)

**SK\_LLCCREDTYPE\_TLV (0x0004)**

| Description | Byte (Value)                                                                                             |
|-------------|----------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x0004 (SK_LLCCREDTYPE_TLV)                                                                 |
| Length      | Data[2, 3] = 0x0001                                                                                      |
| Value       | Data[4] = Type<br><br>0x01 - LLC was started as primary<br>0x02 - LLC was started as redundant (with -r) |

**SK\_LLCCREDSTATE\_TLV (0x0005)**

| Description | Byte (Value)                                                                                                                                                                                                                                                            |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Report Types

The TLVs in this section are used to report the status of the LLC socket connections.

- SK\_PM\_CHANGE
- SK\_SSC\_UPDATE
- SK\_LINK\_UP
- SK\_LINK\_DOWN

These report types are unsolicited messages that report the status of socket connections between the LLC and its devices, in particular, devices that share a logical node but are on unique logical links (i.e. direct connections to the SS7 for TCAP).

The following list describes the conditions that will cause the LLC to send these reports within the GenericLLCReport:

- **SK\_PM\_CHANGE**  
Sent when the first poll is received by the LLC for a CSP Matrix Series 3 Card. Also sent any time a value changes in the Poll. The UpdatedFieldBits field indicates which fields have changed since the last poll.
- **SK\_SSC\_UPDATE**  
Sent when an application issues an AddLLCCard. An SSC\_UPDATE may be generated if the LLC already knew about the device and the LLC is currently connected to the active device within that node. In other words, if the Link is considered to be up.
- **SK\_LINK\_UP**  
Sent to indicate that there is a connection to the active device for this node and the device is ready to be configured. This will be sent if this is a new condition (i.e. the LLC was not previously connected to the active Device).
- **SK\_LINK\_DOWN**  
Sent to indicate that there is NO connection to the active Device for a node. This will be sent if this is a new condition (that is, we were previously connected to the active Device).

**Important!** Performing an AddLLCCard will result in an SK\_SSC\_UPDATE with the last poll from the active Device, if the LLC is currently connected to the Device in the active state.

**SK\_POLL\_DATA\_TLV (0x1000)**

| Value              | Data[4,5] = Requested Logical Node ID |

## Report Types

The TLVs in this section are used to report the service state of channel groups being watched by an application.

- SK\_GROUP\_WATCHER\_STATUS
- SK\_CHANNEL\_RANGE\_STATUS

| Report Type             | SK_CHANNEL_GROUP_TLV | SK_CHANNEL_RANGE_TLV |
|-------------------------|----------------------|----------------------|
| SK_GROUP_WATCHER_STATUS | 1                    |                      |
| SK_CHANNEL_RANGE_STATUS |                      | 1                    |

### SK\_CHANNEL\_GROUP\_TLV (0x1004)

In the event that the environment variable SK\_CHANNEL\_RECOVERY\_METHOD=0x03 (All\_OUT\_OF\_SERVICE) is set or a *ForceGroupState* message is received, the LLC has the ability to take entire groups of channels in-service and out-of-service. In the event that this occurs a "master" application can be created that monitors this behavior by registering for GenericLLCReports and parsing a new report type within it called SK\_GROUP\_WATCHER\_STATUS.

| Description | Byte (Value)                                                                                                                                    |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag         | Data[0, 1] = 0x1004<br>(SK_CHANNEL_GROUP_TLV)                                                                                                   |
| Length      | Data[2, 3] = 0x0034                                                                                                                             |

### SK\_CHANNEL\_RANGE\_TLV (0x1005)

In the event that the environment variable SK\_CHANNEL\_RECOVERY\_METHOD=0x03 (All\_OUT\_OF\_SERVICE) is set or a *ForceGroupState* message is

received, the LLC has the ability to take entire groups of channels in-service and out-of-service. In the event that this occurs a "master" application can be created that monitors this behavior by registering for GenericLLCReports and parsing a new report type within it called SK\_CHANNEL\_RANGE\_STATUS.

| Description | Byte (Value)                                                                                                                                                                                                        |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Possible TLV Combinations**

| Report Type   | SK_LNI_TLV | SK_POLL_DATA_TLV | SK_IPV4_TLV |
|---------------|------------|------------------|-------------|
| SK_PM_CHANGE  | 1          | 1                | 1           |
| SK_SSC_UPDATE | 1          | 1                | 1           |
| SK_LINK_UP    | 1          | 0                | *           |
| SK_LINK_DOWN  | 1          | 0                | **          |

\* A Report Type will contain at least one of these TLVs. The CSP Matrix Series 3 Card represented by the first TLV in a series will always indicate the current Active.

\*\* A Report Type will contain at least one of these TLVs. When a series of TLVs is sent by the LLC, the order of the TLVs is irrelevant. When the link is down the LLC does not know which is Active or not.

# HostAlarm

---

- Type** SwitchKit API message
- Description** Use the *SK\_HostAlarm* message to allow SwitchKit applications to generate alarms or events that can be sent to other SwitchKit applications. Receiving applications, such as SNMP processes will be able to register to receive this class of message.
- Sent by** Application
- Arguments** The following table shows the arguments you can change:

| Argument       | Description                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| AppName        | A text string used to uniquely identify the application sending the message. (ASCII String 64 characters maximum) |
| AlarmTime      | This is the number of seconds since January 1 1970.                                                               |
| IPAddrOfSender | This field will contain the IP Address of the host system where the problem originated                            |
| AlarmMajor     | See Table 1:Alarm Types                                                                                           |
| AlarmSubType   | See Table 2: Alarm Sub-types/Probable Cause                                                                       |
| AlarmSeverity  | See Table 3:Alarm Severity                                                                                        |
| TLVCount       | The number of data items associated with this message                                                             |
| TLVData        | SeeTable 4: TLV Data Types                                                                                        |

**Configuration** Syntax, if able to send, is through SMgr

**C Structure**

```
typedef struct {
 UBYTE IPAddrOfSenderSize;
 UBYTE reserved5[12];
 char AppName[64];
 int AlarmTime;
 UBYTE IPAddrOfSender[4];
 UBYTE AlarmMajor;
```

```

 UBYTE AlarmSubType;
 UBYTE AlarmSeverity;
 UBYTE TLVCount;
 UBYTE TLVData[177];
} SK_HostAlarm;

```

**C Structure Response**

```

typedef struct {
 int Status;
 UBYTE reserved21[4];
} SK_HostAlarmAck;

```

**C++ Class**

```

class SKC_HostAlarm : public SKC_ToolkitMessage {
public:
 UBYTE getIPAddrOfSenderSize() const;
 void setIPAddrOfSenderSize(UBYTE x);
 const char *getAppName() const;
 void setAppName(const char *x);
 int getAlarmTime() const;
 void setAlarmTime(int x);
 const UBYTE *getIPAddrOfSender() const;
 UBYTE *getIPAddrOfSender();
 void setIPAddrOfSender(UBYTE *x);
 UBYTE getAlarmMajor() const;
 void setAlarmMajor(UBYTE x);
 UBYTE getAlarmSubType() const;
 void setAlarmSubType(UBYTE x);
 UBYTE getAlarmSeverity() const;
 void setAlarmSeverity(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getTLVData() const;
 UBYTE *getTLVData();
 void setTLVData(UBYTE *x);
};

```

**C++ Class Response**

```

class SKC_HostAlarmAck : public SKC_ToolkitAck {
public:
 int getStatus() const
 void setStatus(int x)
};

```

**Table 1:Alarm Types**

| Name                      | Value as Defined    | Description                                                                                                                                    |
|---------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Communications Alarm Type | SK_COMMUNICATIONS 1 | An alarm of this type is principally associated with the procedures and/or processes required to convey information from one point to another. |

| Name                        | Value as Defined      | Description                                                                                                                 |
|-----------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| QOS Alarm Type              | SK_QUALITYOFSERVICE 2 | An alarm of this type is principally associated with degradation in the quality of a service.                               |
| Processing Error Alarm Type | SK_PROCESSINGERROR 3  | An alarm of this type is principally associated with a software or processing fault.                                        |
| Equipment Alarm Type        | SK_EQUIPMENT 4        | An alarm of this type is principally associated with an equipment fault                                                     |
| Environmental Alarm Type    | SK_ENVIRONMENTAL 5    | An alarm of this type is principally associated with a condition relating to an enclosure in which the equipment resides.it |

**Table 2: Alarm Sub-types/Probable Cause**

| Name                             | Value as Defined                   | Description                                                                                                                                                                              |
|----------------------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adapter error                    | SK_ADAPTERERROR 1                  |                                                                                                                                                                                          |
| Application subsystem failure:   | SK_APPLICATIONSUBSYSTEMFAILURE 2   | A failure in an application subsystem has occurred (an application subsystem may include software to support the Session, Presentation or Application layers)                            |
| Bandwidth reduced                | SK_BANDWIDTHREDUCED 3              | The available transmission bandwidth has decreased                                                                                                                                       |
| Call establishment error         | SK_CALLESTABLISHMENTERROR 4        | An error occurred while attempting to establish a connection                                                                                                                             |
| Communications protocol error    | SK_COMMUNICATIONPROTOCOLERROR 5    | A communication protocol has been violated                                                                                                                                               |
| Communications subsystem failure | SK_COMMUNICATIONSUBSYSTEMFAILURE 6 | A failure in a subsystem that supports communications over telecommunications links, these may be implemented via leased telephone lines, by X.25 networks, token-ring LAN, or otherwise |

| Name                                  | Value as Defined                       | Description                                                                                                                                                                                            |
|---------------------------------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration or customization error: | SK_CONFIGURATIONORCUSTOMIZATIONERROR 7 | A system or device generation or customization parameter has been specified incorrectly, or is inconsistent with the actual configuration                                                              |
| Congestion:                           | SK_CONGESTION 8                        | A system or network component has reached its capacity or is approaching it                                                                                                                            |
| Corrupt data:                         | SK_CORRUPTDATA 9                       | An error has caused data to be incorrect and thus unreliable                                                                                                                                           |
| CPU cycles limit exceeded             | SK_CPUCYCLESLIMITEXCEEDED 10           | A Central Processing Unit has issued an unacceptable number of instructions to accomplish a task                                                                                                       |
| Dataset or modem error                | SK_DATASETORMODEMERROR 11              | An internal error has occurred on a dataset or modem                                                                                                                                                   |
| Degraded signal                       | SK_DEGRADED SIGNAL 12                  | The quality or reliability of transmitted data has decreased                                                                                                                                           |
| DTE-DCE interface error:              | SK_DTEDCEINTERFACEERROR 13             | A problem in a DTE-DCE interface, which includes the interface between the DTE and DCE, any protocol used to communicate between the DTE and DCE and information provided by the DCE about the circuit |
| Enclosure door open                   | SK_ENCLOSUREDOOROPEN 14                |                                                                                                                                                                                                        |
| Equipment malfunction                 | SK_EQUIPMENTMALFUNCTION 15             | An internal machine error has occurred for which no more specific Probable cause has been identified                                                                                                   |
| Excessive vibration:                  | SK_EXCESSIVEVIBRATION 16               | Vibratory or seismic limits have been exceeded                                                                                                                                                         |
| File error:                           | SK_FILEERROR 17                        | The format of a file (or set of files) is incorrect and thus cannot be used reliably in processing                                                                                                     |
| Fire detected                         | SK_FIREDETECTED 18                     |                                                                                                                                                                                                        |
| Flood detected                        | SK_FLOODDETECTED 19                    |                                                                                                                                                                                                        |

| <b>Name</b>                                    | <b>Value as Defined</b>              | <b>Description</b>                                                                                       |
|------------------------------------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------|
| Framing error                                  | SK_FRAMINGERROR 20                   | An error in the information that delimits the bit groups within a continuous stream of bits              |
| Heating/ventilation/<br>cooling system problem | SK_HEATORVENTORCOOLSYSTEM<br>PROBLEM |                                                                                                          |
| Humidity unacceptable                          | SK_HUMIDITYUNACCEPTABLE<br>22        | The humidity is not within acceptable limits                                                             |
| I/O device error                               | SK_INPUTOUTPUTDEVICEERROR<br>23      | An error has occurred on the I/O device                                                                  |
| Input device error                             | SK_INPUTDEVICEERROR 24               | An error has occurred on the input device                                                                |
| LAN error                                      | SK_IANERROR 25                       | An error has been detected on a local area network                                                       |
| Leak detected:                                 | SK_LEAKDETECTED 26                   | A leakage of (non-toxic) fluid or gas has been detected                                                  |
| Local node transmission<br>error:              | SK_LOCALNODETRANSMISSIONER<br>ROR 27 | An error occurred on a communications channel between the local node and an adjacent node                |
| Loss of frame                                  | SK_LOSSOFFRAME 28                    | An inability to locate the information that delimits the bit grouping within a continuous stream of bits |
| Loss of signal                                 | SK_LOSSOFSIGNAL 29                   | An error condition in which no data is present on a communications circuit or channel                    |
| Material supply<br>exhausted                   | SK_MATERIALSUPPLYEXHAUSTED<br>30     | A supply of needed material has been exhausted                                                           |
| Multiplexer problem                            | SK_MULTIPLEXERPROBLEM 31             | An error has occurred while multiplexing communications signals                                          |
| Out of memory                                  | SK_OUTOFMEMORY 32                    | There is no program-addressable storage available.                                                       |
| Output device error                            | SK_OUTPUTDEVICEERROR 33              | An error has occurred on the output device                                                               |
| Performance degraded                           | SK_PERFORMANCEDEGRADED<br>34         | Service agreements or service limits are outside of acceptable limits                                    |

| Remote node transmission error         | SK_REMOTE NODE TRANSMISSION ERROR 42         | An error occurred on a communication channel beyond the adjacent node                                                      |
| Resource at or nearing capacity        | SK_RESOURCE AT OR NEARING CAPACITY 43        | The usage of a resource is at or nearing the maximum allowable capacity                                                    |
| Response time excessive                | SK_RESPONSE TIME EXCESSIVE 44                | The elapsed time between the end of an inquiry and beginning of the answer to that inquiry is outside of acceptable limits |
| Retransmission rate excessive          | SK_RETRANSMISSION RATE EXCESSIVE 45          | The number of repeat transmissions is outside of acceptable limits                                                         |
| Software error                         | SK_SOFTWARE ERROR 46                         | A software error has occurred for which no more specific Probable cause can be identified                                  |
| Software program abnormally terminated | SK_SOFTWARE PROGRAM ABNORMALLY TERMINATED 47 | A software program has abnormally terminated due to some unrecoverable error condition                                     |
| Software program error                 | SK_SOFTWARE PROGRAM ERROR 48                 | An error has occurred within a software program that has caused incorrect results                                          |
| Storage capacity problem               | SK_STORAGE CAPACITY PROBLEM 49               | A storage device has very little or no space available to store additional data                                            |

| <b>Name</b>                     | <b>Value as Defined</b>             | <b>Description</b>                                                                                                                                  |
|---------------------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Temperature unacceptable        | SK_TEMPERATUREUNACCEPTABLE 50       | A temperature is not within acceptable limits                                                                                                       |
| Threshold crossed               | SK_THRESHOLDCROSSED 51              | A limit (configurable or not) has been exceeded                                                                                                     |
| Timing problem                  | SK_TIMINGPROBLEM 52                 | A process that requires timed execution and/or coordination cannot complete, or has completed but cannot be considered reliable                     |
| Toxic leak detected             | SK_TOXICLEAKDETECTED 53             | A leakage of toxic fluid or gas has been detected                                                                                                   |
| Transmit failure                | SK_TRANSMITFAILURE 54               |                                                                                                                                                     |
| Transmitter failure             | SK_TRANSMITTERFAILURE 55            |                                                                                                                                                     |
| Underlying resource unavailable | SK_UNDERLYINGRESOURCEUNAVAILABLE 56 | An entity upon which the reporting object depends has become unavailable                                                                            |
| Version mismatch                | SK_VERSIONMISMATCH 57               | There is a conflict in the functionality of versions of two or more communicating entities which may affect any processing involving those entities |
| License verification failure    | SK_LICENSE 58                       | A node's license verification failed.                                                                                                               |
| Node in use                     | SK_NODE_IN_USE 59                   | An attempt was made to add a duplicate node to the LLC's node list.                                                                                 |
| Node created                    | SK_NODE_CREATED 60                  | A node was added to the LLC's node list. Initiates a severity level of SK_INFORMING.                                                                |
| Node removed                    | SK_NODE_REMOVED 61                  | A node was removed from the LLC's node list. Initiates a severity level of SK_INFORMING                                                             |

**Table 3: Alarm Severity**

| <b>Name</b>   | <b>Value as Defined</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cleared       | SK_CLEARED 1            | The Cleared severity level indicates the clearing of one or more previously reported alarms. This alarm clears all alarms for this managed object that have the same Alarm type, Probable cause and Specific problems (if given). Multiple associated notifications may be cleared by using the Correlated notifications parameter (defined below).              |
| Indeterminate | SK_INDETERMINATE 2      | The Indeterminate severity level indicates that the severity level cannot be determined.                                                                                                                                                                                                                                                                         |
| Major         | SK_MAJOR 5              | The Major severity level indicates that a service affecting condition has developed and an urgent corrective action is required. Such a severity can be reported, for example, when there is a severe degradation in the capability of the managed object and its full capability must be restored.                                                              |
| Critical      | SK_CRITICAL 6           | The Critical severity level indicates that a service affecting condition has occurred and an immediate corrective action is required. Such a severity can be reported, for example, when a managed object becomes totally out of service and its capability must be restored.                                                                                    |
| Minor         | SK_MINOR 4              | The Minor severity level indicates the existence of a non-service affecting fault condition and that corrective action should be taken in order to prevent a more serious (for example, service affecting) fault. Such a severity can be reported, for example, when the detected alarm condition is not currently degrading the capacity of the managed object. |
| Warning       | SK_WARNING 3            | The Warning severity level indicates the detection of a potential or impending service affecting fault, before any significant effects have been felt. Action should be taken to further diagnose (if necessary) and correct the problem in order to prevent it from becoming a more serious service-affecting fault.                                            |

**Table 4: TLV Data Types**

| <b>Name</b>   | <b>Value as Defined</b> | <b>Description</b>                                                                                            |
|---------------|-------------------------|---------------------------------------------------------------------------------------------------------------|
| DisplayString | SK_TLV_DISPLAYSTRING 1  | ASCII text string. Characters greater than or equal to 0x20 and characters less than 0x7e, 64 characters max. |
| Integer       | SK_TLV_INTEGER 2        | Integer field                                                                                                 |

## HostAlarm

| <b>Name</b>     | <b>Value as Defined</b>  | <b>Description</b>                                                                                                                        |
|-----------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| IpAddress       | SK_TLV_IPADDRESS 3       | This application-wide type represents a 32-bit internet address. It is represented as an OCTET STRING of length 4, in network byte-order. |
| PhysicalAddress | SK_TLV_PHYSICALADDRESS 4 | This data type is used to model media addresses. For example, an ethernet address would be represented as a string of 6 octets.           |

## IgnoreChanGroup

---

|                    |                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                             |
| <b>Description</b> | This message is used by the function <code>sk_ignoreChanGroup()</code> if an application calls for that function. |
| <b>Sent by</b>     | Function <code>sk_ignoreChanGroup</code>                                                                          |
| <b>C Structure</b> | <pre>typedef struct {<br/>    } SK_IgnoreChanGroup;</pre>                                                         |
| <b>C++ Class</b>   | <pre>class SKC_IgnoreChanGroup : public SKC_AdminMessage {<br/>public:<br/>    };</pre>                           |

# Inpulsing Parameters Configure 0x0028

---

**SwitchKit Name** InpulsingParametersConfig

**Type** EXS API and SwitchKit API message

**Description** **Inpulsing Parameters Configure 0x0028**

The *Inpulsing Parameters Configure* message allows the host to configure impulse data collection parameters on specified channels. Use impulse parameters when data is collected by means of an *Inseize Control* instruction. Call setup inpulsing parameters define the address signaling type, number of digit strings, and collection method used during call setup.

The CSP supports four different inpulsing stages, and each stage is defined as either one or two digit strings. When instructing the CSP to collect address signaling information that is typically presented with in-band dual frequency tones, the host must specify a preprogrammed inpulsing stage that describes how to perform the digit collection.

Each channel has four inpulsing stages that can be preprogrammed. The inpulsing stage configuration options include: the address signaling type (DTMF, MFR1, MFR2), the number of strings (1 or 2), and the string collection method (fixed number digits, KP/ST framed, compelled).

**Sent by** Host

**Example Message (Socket Log Output for SwitchKit)**

The following socket log output/example message shows data being sent from the host to the CSP to configure impulse data collection parameters on span 0x00, channels 0x00 - 0x17. The stage number being configured is 0x01 and the number of digit strings in the stage is 0x01. The stage complete timeout is three seconds and the address signaling type is DTMF. This message collects seven digits.

**Default Inpulse Parameters** The number of strings for each stage for each span listed below is 1.

**T1 Spans**

The information for each stage is identical.

Stages 1–4

|                        |                                                    |
|------------------------|----------------------------------------------------|
| Stage Complete Timer   | 12,000 ms                                          |
| Address Signaling Type | MFR1                                               |
| Collection Method      | Use KP_ST, KP, and ST digits not reported to host. |

**E1 Spans**

Stage 1

|                        |                  |
|------------------------|------------------|
| Stage Complete Timer   | 12,000 ms        |
| Address Signaling Type | MFR2             |
| Collection Method      | Compelled        |
| Collection Data        | 0x03 (Area Code) |

Stage 2

|                        |                             |
|------------------------|-----------------------------|
| Stage Complete Timer   | 12,000 ms                   |
| Address Signaling Type | MFR2                        |
| Collection Method      | Compelled                   |
| Collection Data        | 0x0A (CLI, Calling Line ID) |

Stage 3

|                        |                             |
|------------------------|-----------------------------|
| Stage Complete Timer   | 12,000 ms                   |
| Address Signaling Type | MFR2                        |
| Collection Method      | Compelled                   |
| Collection Data        | 0x07 (Called Party Address) |

Stage 4

|                        |                               |
|------------------------|-------------------------------|
| Stage Complete Timer   | 12,000 ms                     |
| Address Signaling Type | MFR2                          |
| Collection Method      | Compelled                     |
| Collection Data        | 0x01 (Group 2 Category Digit) |

# Inpulsing Parameters Query 0x0089

---

**SwitchKit Name**    InpulsingParametersQuery

**Type**            EXS API and SwitchKit API message

**Description**    **Inpulsing Parameters Query 0x0089**

This host uses this message to query the inpulsing parameters configured on the specified channel. The response from the CSP reports four two-string stages, even if there is no configuration for a stage (which is reported as 0x00).

**Sent by**         Host

**SwitchKit Code**    **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
} XL_InpulsingParametersQuery;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 unsigned short Stage1Timer;
 UBYTE Stage1Strings;
 UBYTE Reserved1;
 UBYTE Stage1String1Type;
 UBYTE Stage1String1Method;
 UBYTE Stage1String1MethodData;

# Inseize Control 0x002B

---

**SwitchKit Name** InseizeControl

**Type** EXS API and SwitchKit API message

**Description** **Inseize Control 0x002B**

Use this message to control incoming call setup during real-time call processing on a specified channel. Instructions and data are passed in this message in the form of Information Control Blocks (ICBs).

You can preprogram a list of instructions using the *Inseize Instruction List Configure* message and initiate them by sending the *Inseize Control* message with an ICB of “Use Instruction List”.

The system does not replace the default instruction list with the list you specify with the “Use Instruction List” ICB. The system concatenates the list you specify in this message to the default list.

An instruction that is not carried out is reported via a negative acknowledgment. A positive acknowledgment is reported only if you include a “Send Host Acknowledgment” Action ICB in the message.

**Related Messages**

- *Inseize Instruction List Configure* 0x0029 (InseizeInstrListConfig)
- *Call Control Instructions Query* 0x0087 (CallControlInstructionQuery)

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE ICBCount;
 UBYTE ICBDData[222];
} XL_InseizeControl;
```

**C++ Class**

```
class XLC_InseizeControl : public XLC_OneChannelOutbound
{
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getICBCount() const;
 void setICBCount(UBYTE x);
 const UBYTE *getICBDData() const;
 UBYTE *getICBDData();
 void setICBDData(UBYTE *x);
};
```

**EXS API Hex Format**

# Inseize Instruction List Configure 0x0029

---

**SwitchKit Name** InseizeInstrListConfig

**Type** EXS API and SwitchKit API message

**Description** **Inseize Instruction List Configure 0x0029**

Use several of these messages to form a list of configuration instruction for inseize control. You must send a separate *Inseize Instruction List Configure* message for each instruction that you add to the list.

After configuring a channel with an inseize instruction list, the CSP executes the list upon detecting an inseizure on the channel.

The last instruction in a list should always be “Wait For Host Control” or “Wait for Host Control with Answer Supervision,” where the CSP waits for further instructions from the host to continue processing.

**NOTE:** A seize instruction *cannot* be preprogrammed.

**T-ONE Card**

When performing Immediate Start on E&M trunks on a T-ONE card, the first inseize instruction must be Generate Inseize ACK.

**Related Messages**

- *Inseize Control* 0x002B (InseizeControl)
- *Call Control Instructions Query* 0x0087 (CallControlInstructionQuery)

**Sent by** Host

**Example Message**

The following example message is sent from the host to the CSP to configure an Inseize instruction list on spans 0, 1, 2, 3 - channels 0-23.

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
ff 00 00 00
```

Clear Instruction List

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
01 07 00 00
```

Generate Inseize Acknowledgment

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
02 03 01 00
```

Receive Stage 1 Digits

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
03 02 04 00
```

Generate Call Processing Event (Wink 2)

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
04 06 00 00
```

Report Incoming Call With Address Data

```
00 15 00 29 00 00 ff 01 02 0d 03 00 00 00 0d 03 00 03 17
05 04 00 00
```

Wait For Host Control

## SwitchKit Code Configuration

```
InseizeInstrListConfig (
 Node = integer,
 Range = StartSpan:StartChan - EndSpan:EndChan,
 InstrNum = integer,
 InstrType = integer,
 InstrData1 = integer,
 InstrData2 = integer);
```

## C Structure

```
typedef struct {
 unsigned short StartSpan;
 UBYTE StartChannel;
 unsigned short EndSpan;
 UBYTE EndChannel;
 UBYTE InstrNum;
 UBYTE InstrType;
 UBYTE InstrData1;
 UBYTE InstrData2;
} XL_InseizeInstrListConfig;
```

## C++ Class

```
class XLC_InseizeInstrListConfig : public
 XLC_ChanRangeMessage {
public:
 unsigned short getStartSpan() const;
 void setStartSpan(unsigned short x);
 UBYTE getStartChannel() const;
 void setStartChannel(UBYTE x);
 unsigned short getEndSpan() const;
 void setEndSpan(unsigned short x);
 UBYTE getEndChannel() const;
 void setEndChannel(UBYTE x);
 UBYTE getInstrNum() const;
 void setInstrNum(UBYTE x);
 UBYTE getInstrType() const;
 void setInstrType(UBYTE x);
 UBYTE getInstrData1() const;
 void setInstrData1(UBYTE x);
 UBYTE getInstrData2() const;
 void setInstrData2(UBYTE x);
};
```

# InterAppMsg

---

**Type**      SwitchKit API message

**Description**    Use the *SK\_InterAppMsg* message to send arbitrary information from one application to another. An acknowledgment is sent to the application that originally sent *SK\_InterAppMsg*.

**Important!**    You must call setDataSize before calling setData. If not, data will not be copied into the data field.

C developers must also copy the data manually. Otherwise, the data field will be truncated and the size set to 0 when the message is sent.

**Sent by**       Application

**C Structure**    typedef struct {  
                   int Target;  
                   union {  
                     UBYTE UnAckedMsg;  
                     UBYTE Type;  
                   } union21 ;  
                   unsigned short AckTimeout;  
                   int Tag1;  
                   int Tag2;  
                   int Tag3;  
                   int Tag4;  
                   char AppGroupTarget[16];  
                   unsigned short DataSize;  
                   UBYTE Data[212];  
                   } **SK\_InterAppMsg;**

**C Structure Response**    typedef struct {  
                   int Status;  
                   UBYTE Bytel;  
                   unsigned short Short1;  
                   int Tag1;  
                   int Tag2;  
                   int Tag3;  
                   int Tag4;  
                   unsigned short DataSize;  
                   UBYTE Data[228];  
                   } **SK\_InterAppMsgAck;**

```

C++ Class class SKC_InterAppMsg : public SKC_ToolkitMessage {
public:
 int getTarget() const;
 void setTarget(int x);
 UBYTE getUnAckedMsg() const;
 void setUnAckedMsg(UBYTE x);
 UBYTE getType() const;
 void setType(UBYTE x);
 unsigned short getAckTimeout() const;
 void setAckTimeout(unsigned short x);

 void setTag1(int x);
 int getTag2() const;
 void setTag2(int x);
 int getTag3() const;
 void setTag3(int x);
 int getTag4() const;
 void setTag4(int x);
 const char *getAppGroupTarget() const;
 void setAppGroupTarget(const char *x);
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

```

C++ Class Response class SKC_InterAppMsgAck : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
 UBYTE getByte1() const;
 void setByte1(UBYTE x);
 unsigned short getShort1() const;
 void setShort1(unsigned short x);
 int getTag1() const;
 void setTag1(int x);
 int getTag2() const;
 void setTag2(int x);
 int getTag3() const;
 void setTag3(int x);
 int getTag4() const;
 void setTag4(int x);
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

**Argument Values** The following table shows the arguments that you can modify in *InterAppMsg* :

| Argument                                 | Values and Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target<br>AppGroupTarget                 | Write the name of the application that is to receive the message into the Target field. If you do not specify Target, AppGroupTarget must contain the text name of the application group that is to receive this message. If both Target and AppGroupTarget are specified, Target is used.                                                                                                                                                                                                                                                                                                               |
| AckTimeout                               | Specifies the minimum time the LLC will wait for an acknowledgement to an InterAppMsg before it considers the InterAppMsg to have timed-out. This field only has meaning if the Type/UnAckedMsg field is set to SK_IAM_WITH_ACK. The actual time-out may be higher than the specified value because of the mechanism that LLC uses to keep track of outstanding requests. In any case, the time-out should occur within five seconds of the time-out value specified by the originator of the message. The default value for time-out, if not specified by the originator of the message, is 15 seconds. |
| Tag 1<br>Tag 2<br>Tag 3<br>Tag 4<br>Data | The Tag and Data fields are provided only for the convenience of the user. SwitchKit simply passes along these fields without any processing. You are responsible for assigning semantic meaning to these fields. The target application will receive a <i>SK_InterAppMsg</i> with all the fields filled in as they were filled in by the sending application.                                                                                                                                                                                                                                           |
| DataSize                                 | DataSize is used to specify how many bytes of data are in the Data array. The default amount of data that can be sent is 212 bytes. It can be increased up to 64KB. Refer to <i>Send Messages Larger than Default</i> .                                                                                                                                                                                                                                                                                                                                                                                  |

| Argument                 | Values and Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type<br>or<br>UnAckedMsg | <p>Specifies the expected behavior for this message.</p> <p>If the sender of the message fails to set this field before sending the message, the default will be <code>SK_IAM_WITH_NO_ACK</code>. In cases where acknowledgement is not expected, the recipient cannot send an acknowledgement using the <code>InterAppMsgAck</code>.</p> <p>There are three values allowed for this field:<br/> <code>SK_IAM_WITH_ACK</code><br/> <code>SK_IAM_BROADCAST</code><br/> <code>SK_IAM_WITH_NO_ACK</code></p> <p><b>SK_IAM_WITH_ACK</b> - The sender of the <code>InterAppMsg</code> expects an acknowledgement from the recipient of the message. If the recipient fails to respond, LLC will generate an acknowledgement to the originator of the <code>InterAppMsg</code> with a status of <code>SK_NO_ACK_FROM_SWITCH</code>. If the recipient is not connected to the LLC, the LLC will generate an acknowledgement to the originator of the <code>InterAppMsg</code> with a status of <code>SK_BAD_APP_NAME</code>. In any case, the acknowledgement will come in the form of a message of type <code>SK_InterAppMsgAck</code>. See <i>Acknowledgment</i>.</p> <p><b>SK_IAM_BROADCAST</b> - The sender of the <code>InterAppMsg</code> would like to send this message to all members of the <code>AppGroupTarget</code> specified in the <code>InterAppMsg</code>. There is no acknowledgement expected for this message.</p> <p><b>SK_IAM_WITH_NO_ACK</b> - The sender of the <code>InterAppMsg</code> would like to send this message to its destination without expecting an acknowledgement.</p> <p>The fields, <code>Type</code> and <code>UnAckedMsg</code>, offer the same capability and therefore the field names are used interchangeably. Only one of the fields needs to be set.</p> |

### Send Messages Larger than Default

The following example shows how to send a message of 2000 bytes, if the structure `SK_InterAppMsg` is used.

```

char storage[2000];
SK_InterAppMsg *msg = (SK_InterAppMsg *)storage;
msg->Data[0] = ...
msg->Tags = ...
char buf[2000];
int sz=2000;
int stat = sk_packMessage((MsgStruct *)msg,buf,&sz);
 if (stat != OK) {
 return stat;
 }
return sk_sendMessageWithHandler(buf,sz,tag,hf);

```

If the class *SKC\_InterAppMsg* is being used, the following example will send a message of 2000 bytes.

```
SKC_InterAppMsg msg(2000);
msg.setData...
msg.setTags...
char buf[2000];
int sz=2000;
int stat = sk_packMessage(msg.getStructPtr(),buf,&sz);
 if (stat != OK) {
 return stat;
 }
return sk_sendMessageWithHandler(buf,sz,tag,hf);
```

### Acknowledgment

To acknowledge *SK\_InterAppMsg*, the application must set the sequence number of the ACK to match the sequence number of the incoming message. For example:

```
int handleInterApp(SK_Event *evt, void *tag) {
 MsgStruct *msg = evt->IncomingMsg;
 SK_MSG_SWITCH(msg) {
 CASE_InterAppMsg(iam) {
 SK_InterAppMsgAck a;
 sk_initMsg(&a,TAG_InterAppMsgAck);
 sk_setSeqNum(&a,sk_getSeqNum(iam));
 a.Status = 0x10;
 sk_sendMsgStruct((MsgStruct *)&a, NULL, NULL);
 break;
 }
 }SK_END_SWITCH;
 return OK; //indicates that message was handled
}
```

If the C++ message classes are being used, the following example will send the ACK to an *SKC\_InterAppMsg*.

```
int handleInterApp(SK_Event *evt, void *tag) {
 SKC_Message *msg = evt->IncomingCMsg;
 SKC_MSG_SWITCH(msg) {
 CASEC_InterAppMsg(iam) {
 SKC_InterAppMsg ack;
 ack.setSeqNum(iam-getSeqNum())
 ack.setStatus(0x10);
 ack.setDataSize(0);
 ack.send();
 break;
 }
 }SKC_END_SWITCH;
 return OK; //indicates that message was handled
}
```

## IP Address Configure 0x00E7

---

**SwitchKit Name** IPAddressConfig

**Type** EXS API and SwitchKit API message

**Description** **IP Address Configure 0x00E7**

Use this message to configure the subnet mask and assign either a single IP address or all IP addresses at once. You do this by matching the number of TLVs to the number of IP addresses being assigned.

You can clear IP addresses by setting all of the IP address and subnet mask data to 0xFF. If you plan to take a card with IP addresses from one chassis and insert it into another chassis, be sure to clear all IP addresses on the card first. Otherwise, there might be a conflict with the IP addresses of the cards in the new chassis.

**NFS for DSP Series 2 card**

To use TFTP or NFS, the DSP Series 2 card must be assigned an IP Address.

**Gateway Address**

In order to assign a Gateway IP Address to a VDAC mother board or any of the four modules, you must include the Gateway IP TLV in the same message as the *IP Address Configure*. You can not assign a Gateway IP Address in a message where the Gateway IP Address is the only TLV in the message.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
IPAddress Config (
 Node = integer,
 Slot = integer,
 DataType = integer,
 TLVCount = integer,
 Data = byte array);
```

**C Structure**

```
typedef struct {
 UBYTE Slot;
 UBYTE DataType;
 UBYTE TLVCount;
 UBYTE Data[221];
} XL_IPAddressConfig;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
```

```

 UBYTE TLVCount;
 UBYTE Data[250];
} XL_IPAddressConfigAck;

```

**C++ Class**

```

class XLC_IPAddressConfig : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getDataType() const;
 void setDataType(UBYTE x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

**C++ Class Response**

```

class XLC_IPAddressConfigAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};

```

**EXS API Hex Format**

| MESSAGE (White) |                                                                                                                 | RESPONSE (Gray) |                                                                                                                                       |

| <b>Sent by</b>        | Host                                                                                                                                                                                                       |

### SwitchKit Code C Structure

```
typedef struct {
 UBYTE Slot;
} XL_IPAddressQuery;
```

### C Structure Response

```
typedef struct {
 unsigned short Status;
 UBYTE TLVCount;
 UBYTE Data[250];
} XL_IPAddressQueryAck;
```

### C++ Class

```
class XLC_IPAddressQuery : public XLC_OutboundMessage {
public:
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
};
```

### C++ Class Response

```
class XLC_IPAddressQueryAck : public
 XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

# IP Signaling Series 3 Card Host Poll 0x0104

---

**Type** EXS API message

**Description** **IP Signaling Series 3 Card Host Poll 0x0104**

This message is sent unsolicited from the IP Signaling Series 3 card to the host on a periodic basis to allow the host to monitor the status of the IP Signaling Series 3 card. The default poll interval is one second.

**Sent by** CSP

**EXS Hex API Format**

# IP Signaling Series 3 Card Query 0x0101

---

**SwitchKit Name** IPCallServerQuery

**Type** EXS API and SwitchKit API message

**Description** **IP Signaling Series 3 Card Query 0x0101**

This message is used by the host to query the details of the configuration data and the status of the IP Signaling Series 3 card interface.

**Message Type** Configuration Query

**Sent By** Host

**EXS Hex API Format**

# IP Signaling Series 3 Card Status Report 0x0105

---

**Type** EXS API message

**Description** **IP Signaling Series 3 Card Status Report 0x0105**

This message is sent unsolicited from the IP Signaling Series 3card to the host in different scenarios. This is generally caused by some Matrix interaction of which the host requires notification.

**Sent by** CSP

# ISDN Interface Configure 0x0060

---

**SwitchKit Name** ISDNInterfaceConfig

**Type** EXS API and SwitchKit API message

**Description** **ISDN Interface Configure 0x0060**

Use this message to configure general options to an ISDN interface. It should be sent immediately following the *D Channel Assign* message.

**NOTE:** PCM encoding for channels controlled by the D channel is defaulted based on the network signaling variant. E-1 spans configured for Euro-ISDN default to a-law, while all other variants default to  $\mu$ -law. For more information, see the message *PCM Encoding Format Configure (0x00D9)*.

**Sent by** Host

**SwitchKit Code** **Configuration**

```
ISDNInterfaceConfig (
 Node = integer,
 Span = integer,
 Channel = integer,
 Entity = integer,
 Data = byte array);
```

## C Structure

```
typedef struct {
 unsigned short Span;
 UBYTE Channel;
 UBYTE Entity;
 UBYTE Data[222];
} XL_ISDNInterfaceConfig;
```

## C++ Class

```
class XLC_ISDNInterfaceConfig : public
 XLC_OutboundMessage {
public:
 unsigned short getSpan() const;
 void setSpan(unsigned short x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getEntity() const;
 void setEntity(UBYTE x);
 int getMsgSize() const;
 void setMsgSize(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getData();
 void setData(UBYTE *x);
};
```

**Overview of message** The following table provides an overview of this message. The table following it, provides the detail for each byte.

# ISDN Query 0x0063

---

**SwitchKit Name** ISDNQuery

**Type** EXS API and SwitchKit API message

**Description** **ISDN Query 0x0063**

Use this message to query specific parameters configurable by the *ISDN Terminal Configure*, *ISDN Interface Configure*, and *PPL Configure* messages. Hosts applications should consider that future configuration options will be added to this query message, thus changing the length.

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE AddrInfo[30];
 UBYTE Type;
 UBYTE SubType;
} XL_ISDNQuery;
```

**C Structure Response**

```
typedef struct {
 unsigned short Status;
 UBYTE Data[251];
} XL_ISDNQueryAck;
```

**C++ Class**

```
class XLC_ISDNQuery : public XLC_OutboundMessage {
public:
 const UBYTE *getAddrInfo() const;
 UBYTE *getAddrInfo();
 void setAddrInfo(UBYTE *x);
 XBYTE getSpan() const;
 void setSpan(XBYTE x);
 UBYTE getChannel() const;
 void setChannel(UBYTE x);
 UBYTE getSlot() const;
 void setSlot(UBYTE x);
 UBYTE getType() const;
 void setType(UBYTE x);
 UBYTE getSubType() const;
 void setSubType(UBYTE x);
};
```

**C++ Class Response**

```
class XLC_ISDNQueryAck : public XLC_AcknowledgeMessage {
public:
 unsigned short getStatus() const;
 void setStatus(unsigned short x);
```

```

const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x);
};

```

**EXS API Hex Format**

| MESSAGE |                                 | RESPONSE |                           |

**0x04 IE Library**

Data[0] Entry Number (0–29)  
 Data[1] IE Type  
     0x01 Q.931 IEs  
 Include the following data fields only if Data[1] above is 0x01 (Q.931 IE type):  
 Data[2] Total IE Length (1–28)  
 Data[3. . .] IE Data

**0x05 HDLC Statistics**

Data[0, 1] Long Frames Detected  
 Data[2, 3] Aborts Received  
 Data[4, 5] CRC Errors  
 Data[6, 7] Short Frames  
 (Counters are reset after Query)

**0x06 USOP Database**

Eight blocks of information are reported for each USOP block configured on the D channel.  
 The format of each block is as follows:

Data[0-11] USPID  
 Data[12-21] Directory Number  
 Data[22] GSP Index  
 Data[23] Terminal Initialization Method  
     0x00 Auto FIT  
     0x01 Fixed NIT  
     0x02 Fixed FIT  
     0x80 Auto NIT with DN  
     0x81 Auto NIT with no Calling Party Number indicated  
     (use default USOP)  
 Data[24] Fixed Terminal Endpoint Identifier (TEI) (0–63)

**0x08 Congestion Data**

Message Responses:

- Data [0- 3] Level 2 burst threshold
- Data [4-7] Level 2 average threshold
- Data [8-11] Abatement threshold
- Data [12-15] Burst time window
- Data [16-19] Number of samples in average
- Data [20-23] Abatement window
- Data [24-27] Level 1 burst threshold
- Data [28-31] Level 1 average threshold

**0x0E Configured D Channels**

Message Responses:

- Data [0, 1] Maximum Number of D-Channels Configurable (MSB, LSB)
- Data [2, 3] D-Channel 1 - Logical Span ID (MSB, LSB)
- Data [4] D-Channel 1 - Channel
- Data [5] Primary Flag (0x00 if Primary, 0x01 if Secondary)
- :
- :
- Data [n -]

NOTE: D-channels that are not configured will return a value of 0xFF FF FF FF.

**0x0D Super Rate LAPD**

- Data[0,1] D Channel offset (as specified in D Channel Assign 0xC4)
- Data[2,3] Super Rate base channel (DSO)
- Data[4,5] Number of DSOs for Super Rate

## ISDN Terminal Configure 0x0062

| <b>Description</b>    | <p><b>J1 Span Configure 0x0019</b></p> <p>This message is used by the host to configure the transmitted pattern of certain bits in different frames of a multi-frame over the J-ONE interface.</p> <p><b>NOTE:</b> Before changing span configuration, Dialogic ALWAYS RECOMMENDS that you de-assign the spans, assign them again and then send the new span configuration.</p> |

**Sent by** Host

**SwitchKit Code** **Configuration**

```
J1SpanConfig (
 Node = integer,
 StartSpanRange = integer,
 EndSpanRange = integer,
 ChanData = byte array,
 FrameData = byte array);
```

**C Structure**

```
typedef struct {
 unsigned short StartSpanRange;
 unsigned short EndSpanRange;
 UBYTE ChanData[6];
 UBYTE FrameData[217];
} XL_J1SpanConfig;
```

**C++ Class**

```
class XLC_J1SpanConfig : public XLC_SpanRangeMessage {
public:
 XBYTE getStartSpan() const;
 XBYTE getEndSpan() const;
 void setStartSpan(XBYTE s);
 void setEndSpan(XBYTE s);
 unsigned short getStartSpanRange() const;
 void setStartSpanRange(unsigned short x);
 unsigned short getEndSpanRange() const;
 void setEndSpanRange(unsigned short x);
 const UBYTE *getChanData() const;
 UBYTE *getChanData();
 void setChanData(UBYTE *x);
 const UBYTE *getFrameData() const ;
```

```
UBYTE *getFrameData();
void setFrameData(UBYTE *x);
};
```

## Line Card Switchover 0x0024

---

**SwitchKit Name** LineCardSwitchover

**Type** EXS API and SwitchKit API message

**Description** **Line Card Switchover 0x0024**

This message initiates a switchover from an active line card or EXNET card to a standby card in redundant system. The standby cards must be configured using the *Standby Line Card Configure* message before this message can be used to initiate a switchover.

A switchover can be initiated using this message for the following cards:

- EXNET-ONE
- T-ONE
- E-ONE
- J-ONE

**Sent by** Host

**SwitchKit Code** **C Structure**

```
typedef struct {
 UBYTE OrigSlot;
 UBYTE DestSlot;
} XL_LineCardSwitchover;
```

**C++ Class**

```
class XLC_LineCardSwitchover : public XLC_OutboundMessage
{
public:
 UBYTE getOrigSlot() const;
 void setOrigSlot(UBYTE x);
 UBYTE getDestSlot() const;
 void setDestSlot(UBYTE x);
};
```

**EXS API Hex Format**

|                    |                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | SwitchKit API message                                                                                                                                                       |
| <b>Purpose</b>     | Use LLCControl to manage the behavior of LLC. LLCControl can be used to dynamically modify environment variables and to manage SS7 redundancy.                              |
| <b>Description</b> | The message is used for controlling or modifying the behavior of the LLC. The message consists of a sequence of TLVs, a command TLV followed by one or more parameter TLVs. |

## Establish Redundancy

The *SK\_LLC\_CONTROL\_ESTABLISH\_REDUNDANCY\_TLV* is used to initiate synchronization between components that are configured as redundant pairs. Synchronization can only be initiated if the components have been previously configured as redundant pairs and each component is in a state where synchronization can commence. A successful reply to this message indicates that the synchronization process has been initiated. It does not indicate the success or failure of that synchronization process.

The use of this TLV requires that the ComponentType and PrimaryLNI TLV's also be included and properly defined. The only component type supported is SS7 (0x1000).

## Control Switchover

*SK\_LLC\_CONTROL\_SWITCHOVER\_COMP\_TLV* (0x0021) is used to initiate a switchover of fully synchronized, redundant components. Switchover can only be initiated if the components have been previously configured as redundant pairs and each component is in a state where switchover can occur. A successful reply to this message indicates that the switchover process has been initiated. It does not indicate the success or failure of that switchover process.

The use of this TLV requires that the Component Type and Primary LNI TLV's also be included and properly defined. The only component type supported is SS7(0x1000).

**Sent by** Application

**How to use** To use *LLCControl*, construct the message and set the TLV information.

```
SKC_LLCCControl lq;
lq.setDataSize(DataSize);
lq.setTLVCount(TLVCount);
lq.setData(data);
```

**Arguments** The following table shows the arguments you can change:

| Argument | Description                  |
|----------|------------------------------|
| DataSize | Number of bytes of the data. |
| TLVCount | Number of TLVs in the data.  |
| data     | Data bytes.                  |

**Status Argument**

The following are values that can be returned in the Status argument of *LLCControlAck*

| Value                            | Description                                                                |
|----------------------------------|----------------------------------------------------------------------------|
| SK_BAD_PARAM                     | Returned if there is an unknown command TLV.                               |
| SK_BAD_OR_MISSING_PARAM          | A required parameter TLV is missing from the LLCControl.                   |
| SK_NODE_NOT_PREVIOUSLY_DEFINED   | A node specified in a parameter TLV is unknown to the LLC.                 |
| SK_UNABLE_TO_INITIATE_SYNC       | An attempt to initiate synchronization of SS7 redundant components failed. |
| SK_UNABLE_TO_INITIATE_SWITCHOVER | An attempt to initiate switchover of SS7 redundant components failed.      |
| SK_UNKNOWN_REDUNDANT_COMPONENT   | The specified redundant component is unknown.                              |

**Command TLVs SK\_LLC\_CONTROL\_ESTABLISH\_REDUNDANCY (0x0015)**

| Byte   | Description                                               |
|--------|-----------------------------------------------------------|
| Tag    | Data[0, 1] = SK_LLC_CONTROL_ESTABLISH_REDUNDANCY (0x1015) |
| Length | Data[2,3] = 0x0000                                        |

**SK\_LLC\_CONTROL\_SWITCHOVER\_COMP\_TLV (0x0021)**

| Byte   | Description                                              |
|--------|----------------------------------------------------------|
| Tag    | Data[0, 1] = SK_LLC_CONTROL_SWITCHOVER_COMP_TLV (0x0021) |
| Length | Data[2, 3] = 0x0000                                      |

**Parameter TLVs SK\_LLC\_CONTROL\_GO\_STANDBY\_TLV (0x0016)**

This SK\_LLC\_CONTROL\_GO\_STANDBY\_TLV will cause an LLC switchover. The current Active LLC will become Standby and will inform the current Standby (if any) that it should become Active. Note that switchover behavior is dependant on the current SK\_LLC\_SWITCHBACK\_MODE environment variable. See the environment variables section for details.

| Byte   | Description                                         |
|--------|-----------------------------------------------------|
| Tag    | Data[0, 1] = SK_LLC_CONTROL_GO_STANDBY_TLV (0x0016) |
| Length | Data[2, 3] = 0x0000                                 |
| Value  | Not Applicable                                      |

**SK\_COMPONENT\_TYPE\_TLV (0x1008)**

| Byte   | Description                                 |
|--------|---------------------------------------------|
| Tag    | Data[0, 1] = SK_COMPONENT_TYPE_TLV (0x1008) |
| Length | Data[2, 3] = 0x0002                         |

| Byte  | Description                                                       |
|-------|-------------------------------------------------------------------|
| Value | Data[4, 5] = Component ID (currently only support 0x1000 for SS7) |

**SK\_PRIMARY\_LNI\_TLV (0x1006)**

| Byte   | Description                                                       |
|--------|-------------------------------------------------------------------|
| Tag    | Data[0, 1] = SK_PRIMARY_LNI_TLV (0x1006)                          |
| Length | Data[2, 3] = 0x0002                                               |
| Value  | Data[4, 5] = Component ID (currently only support 0x1000 for SS7) |

**C Structure**

```
typedef struct {
 unsigned short DataSize;
 UBYTE TLVCount;
 UBYTE Data[250];
} SK_LLCControl;
```

**C Structure Response**

```
typedef struct {
 int Status;
 UBYTE reserved21[10]
} SK_LLCControlAck;
```

**C++ Class**

```
class SKC_LLCControl : public SKC_ToolkitMessage {
public:
 unsigned short getDataSize() const;
 void setDataSize(unsigned short x);
 UBYTE getTLVCount() const;
 void setTLVCount(UBYTE x);
 const UBYTE *getData() const;
 UBYTE *getTLVData();
 void setTLVData(UBYTE *x);
};
```

**C++ Class Response**

```
class SKC_LLCControlAck : public SKC_ToolkitAck {
public:
 int getStatus() const;
 void setStatus(int x);
```

# LLCQuery

---

- Type** SwitchKit API message
- Purpose** Use the *LLCQuery* message to query the LLC for information. Currently, only information about configured nodes is available.
- Description** The message is for querying the LLC for node related information. Supported queries include the following:
- Logical Node IDs
  - IP address of the active CSP Matrix Series 3 Card
  - IP address of the standby CSP Matrix Series 3 Card
- Sent by** Application
- How to use** To use *LLCQuery*, construct the message and set the TLV information.
- ```
SKC_LLCQuery1q;
1q.setDataSize(DataSize);
1q.setTLVCount(TLVCount);
1q.setData(data);
```
- Arguments** The following table shows the arguments you can change in LLCQuery:

Argument	Description
DataSize	Number of bytes of the data.
TLVCount	Number of TLVs in the data.
data	Data bytes.

Status

These values can be returned in the Status argument of *SK_LLCQueryAck*.

- SK_BAD_PARAM if unknown, query TLV.
- SK_INVALID_NODE if unknown node ID is given.

TLVs You can use several TLVs with *LLCQuery*. See TLV Syntax:

Queries

- PopulationQueryTLV (0x0002)

- NodeInfoQueryTLV (0x0003)
- LLC_REDUNDANCY_QUERY_TLV (0x0005)

Responses

- NodeInfoTLV (0x8010)
- RequestedMatrixInfoTLV (0x8011)
- RequestedDeviceServerTLV (0x8012)
- RequestedKnownNodeInfoTLV (0x8013)
- *GenericLLCReport* messages

PopulationQuery TLV

The PopulationQuery TLV is used to query the LLC about any nodes it has detected. This TLV can request information on controlled nodes, known nodes, or both controlled and known nodes. A controlled node is any node directly under this LLC's control, while a known node is under another LLC's control.

The valid values for this option are:

ControlledNode (0x01)

KnownNode (0x02)

ControlledAndKnownNode (0x03)

The LLC will respond with an LLCQueryAck with zero or more NodeInfo TLVs; one for each node that matches the criteria: known or controlled. These TLVs reveal the Logical Node ID, the Node Type, and whether the link is up, down, or unknown. If the node is not controlled by this LLC, then the link status will not be known.

If no nodes match the criteria, then an LLCQueryAck will be returned with as a positive ACK with no TLVs.

NodeInfoQuery TLV

The NodeInfoQuery TLV is used to query the LLC about a specific node ID. It has one TLV field: Logical Node ID.

The LLC responds to NodeInfoQuery TLVs with an LLCQueryAck with various TLVs depending on what type of device the node is. These TLVs would be one of the following:

- RequestedMatrixInfoTLV
- RequestedDeviceServer LV

- RequestedKnownNodeInfoTLV

The above TLVs contain all the information the LLC knows about the node. For example, if the device is a standard CSP with two Matrix cards, then the ACK will contain two RequestedMatrixInfo TLVs; one for each card. However, if the node type is a device server, for example, the IP Signaling Series 3 card, the ACK will contain one RequestedDeviceServerTLV. If the node is merely a “known node”, then the RequestedKnownNodeInfoTLV will be returned regardless of what type of node it is.

SK_LLC_REDUNDANCY_QUERY_TLV (0x0005)

The SK_LLC_REDUNDANCY_QUERY_TLV is used to query the redundancy status of the primary and redundant LLCs. The LLC will respond with a *GenericLLCReport* message of type SK_LLC_REDUNDANCY for each LLC. See the *GenericLLCReport* section for details on message behavior and format.

Description	Byte (Value)
Tag	Data[0, 1] = 0x0005 (SK_LLC_REDUNDANCY_QUERY_TLV)
Length	Data[2, 3] = 0x0000
Value	There are no values for this option.

```
C Structure typedef struct {
    unsigned short DataSize;
    UBYTE TLVCount;
    UBYTE Data[250];
} SK_LLCQuery;
```

```
C Structure Response typedef struct {
    unsigned short DataSize;
    int Status;
    UBYTE TLVCount;
    UBYTE Data[246];
} SK_LLCQueryAck;
```

```
C++ Class class SKC_LLCQuery : public SKC_ToolkitMessage {
public:
    unsigned short getDataSize() const;
    void setDataSize(unsigned short x);
    UBYTE getTLVCount() const;
    void setTLVCount(UBYTE x);
```

LLCQuery

```
const UBYTE *getData() const;  
UBYTE *getData();  
void setData(UBYTE *x);  
};
```

C++ Class Response

```
class SKC_LLCQueryAck : public SKC_ToolkitAck {
public:
    unsigned short getDataSize() const;
    void setDataSize(unsigned short x);
    int getStatus() const;
    void setStatus(int x);
    UBYTE getTLVCount() const;
    void setTLVCount(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

TLV Syntax

Below is the definition of all TLVs used in the LLC Query message and the LLC Query Acknowledgement (ACK) message.

PopulationQueryTypeTLV (0x0002)

Description	Byte (Value)
Tag	Data[0, 1] = 0x0002 (PopulationQueryTypeTLV)
Length	Data[2, 3] = 0x0001 (LLCPopulationQuery)
Value	Data[4] = Known Controlled/Both

NodeInfoQueryTLV (0x0003)

Description	Byte (Value)
Tag	Data[0, 1] = 0x0003 (NODEINFOQueryTLV)
Length	Data[2, 3] = 0x0002
Value	Data[4, 5] = Logical Node ID

NodeInfoTLV (0x8010)

Description	Byte (Value)
Tag	Data[0, 1] = 0x8001 (NodeInfoTLV)
Length	Data[2, 3] = 0x0003

Description	Byte (Value)
Value	Data[4, 5] = Logical Node ID Data[6] = Node Type Data[7] = SK_LINK_UP/DOWN/NA

RequestedMatrixInfoTLV (0x8011)

Description	Byte (Value)
Tag	Data[0, 1] = 0x8011 (RequestedMatrixInfoTLV)
Length	Data[2, 3] = 0x000D
Value	Data[4, 5] = Logical Node ID Data[6, 9] = Matrix IP Data[10] = SystemType Data[11] = MatrixSide Data[12] = MatrixState Data[13] = AdjMatrixState Data[14] = StatusBits Data[15, 16] = ExcelPort

RequestedDeviceServerInfoTLV (0x8012)

Description	Byte (Value)
Tag	Data[0, 1] = 0x8012 (RequestedDeviceServerInfoTLV)
Length	Data[2, 3] = 0x000D
Value	Data[4, 5] = Logical Node ID Data[6, 9] = Matrix IP Data[10, 11] = IP Signaling Series 3 status Data[12] = SystemType Data[13] = IP Signaling Series 3 Card Type Data[14] = State Data[15] = Adjacent State Data[16] = StatusBits Data[17] = Reserved

RequestedKnownNodeInfoTLV (0x8013)

Description	Byte (Value)
Tag	Data[0, 1] = 0x8013 (RequestedKnownNodeInfoTLV)
Length	Data[2, 3] = 0x0000
Value	Data[4, 5] = Logical Node ID Data[6, 9] = IP Address

Local End Release Mode Configure 0x0021

SwitchKit Name	LocalReleaseConfig
Type	EXS API and SwitchKit API message
Description	<p>Local End Release Mode Configure 0x0021</p> <p>This message sets a channel's local end release mode, which determines whether a channel is released or parked when the other end of a connection releases.</p>
Sent by	Host

SwitchKit Code Configuration

```
LocalReleaseConfig (
    Node = Integer,
    Range = StartSpan : StartChannel - EndSpan :
    EndChannel,
    ReleaseMode = Integer);
```

C Structure

```
typedef struct {
    BaseFields Base;
    unsigned short StartSpan;
    UBYTE StartChannel;
    unsigned short EndSpan;
    UBYTE EndChannel;
    UBYTE ReleaseMode;
} XL_LocalReleaseConfig;
```

C++ Class

```
class XLC_LocalReleaseConfig : public
    XLC_ChanRangeMessage {
public:
    unsigned short getStartSpan() const;
    void setStartSpan(unsigned short x);
    UBYTE getStartChannel() const;
    void setStartChannel(UBYTE x) ;
    unsigned short getEndSpan() const;
    void setEndSpan(unsigned short x);
    UBYTE getEndChannel() const;
    void setEndChannel(UBYTE x);
    UBYTE getReleaseMode() const;
    void setReleaseMode(UBYTE x);
};
```

Loop Back Configure/Query 0x0091

SwitchKit Name LoopBackConfig

Type EXS API and SwitchKit API message

Description **Loop Back Configure/Query 0x0091**

This message allows you to enable or disable loopback diagnostics on the E-ONE, DS3, and T-ONE line cards. Also, this message will query the loopback mode configured on the card.

Example: The span must be out of service before you send it this message.

Sent By Host

SwitchKit Code **Configuration**

```
LoopBackConfig (
    Node = integer,
    Span = integer,
    LoopbackType = integer);
```

C Structure

```
typedef struct {

Loop Timing Configure 0x004A

SwitchKit Name	LoopTimingConfig
Type	EXS API and SwitchKit API message
Description	Loop Timing Configure 0x004A This message sets or clears loop timing sources.

NOTE: This message not supported on the DS3 card because it is not intended to be a loop timing source.

Sent by Host

Example Message (Socket Log Output in SwitchKit) In the following socket log output/example message, the host clears loop timing on Slot 01, Physical Span 01:

```
00 0D 00 4A 00 00 FF 00 01 13 02 01 01 01 02
```

Matrix Status Report 0x00E5

SwitchKit Name DeviceServerStatusReport

Type EXS API and SwitchKit API message

Description **Matrix Status Report 0x00E5**

This is an unsolicited message sent from the CSP Matrix Series 3 Card to the Host in different situations. This is generally caused by an IP Signaling Series 3 card interaction about which the Host requires information.

NOTE: This message supports a feature of a Dialogic product other than SwitchKit. For this reason, the message is **not to be used in a SwitchKit only environment**.

Sent by CSP

SwitchKit Code **C Structure**

```
typedef struct {
    unsigned short DeviceServer;
    UBYTE TLVCount;
    UBYTE Data[222];
} XL_DeviceServerStatusReport;
```

C++ Class

```
class XLC_DeviceServerStatusReport : public
    XLC_InboundMessage {
public:
    unsigned short getDeviceServer() const;
    void setDeviceServer(unsigned short x);
    UBYTE getTLVCount() const;
    void setTLVCount(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

MessageWrapper

Type SwitchKit API message

Purpose Use *SK_MessageWrapper* to provide the means to tunnel through the LLC. That is, the message to be tunneled is encapsulated inside the MessageWrapper. When the LLC receives a MessageWrapper, it extracts the payload message and delivers the extracted bytes to the proper node.

Payload The payload is a message in CSP format which includes everything from the length up to, but not including, the checksum. Here is a Card Population Query as it would formatted as C-style code:

```
UBYTE CardPop[] = {00, 05, 00, 07, 00, 02, 01};
```

That is: length (00, 05), Message Type (00, 07), Reserved (00), Sequence Number (02), and LNI(01).

The only change LLC will make is to change the Sequence Number to a suitable value following the same rules as any other message. (In-use Sequence Numbers must be unique per message type per device.)

Tunneling through the LLC Message Tunneling is a means of sending a message through the LLC to a device, without LLC attempting to process the message. A message enters the LLC and is delivered directly to the target node. When and if an acknowledgement is received, the LLC delivers to the originating application. Since LLC will not have to examine MessageWrappers for any special processing, the delivery time improves. Occasionally, a new message type is added to the CSP. Since the LLC does limited processing of tunneled messages, it doesn't need to understand the message in order to send it.

Sent by Applications

Arguments The following table shows the arguments you can change:

Parameter	Description
WaitForAck:	Set this field to a non-zero value if an acknowledgement is expected for this message. Otherwise, set it to zero.
PayloadTimeout	If WaitForAck is non-zero, then LLC will wait at least PayloadTimeout seconds for an acknowledgment.
TargetNodeId	The Logical Node ID of the device using this message.
PayloadSize	The payload size in bytes.
Payload	A properly formatted CSP format message including everything from the length up to, but not including, the checksum.

Status Argument

The following are values that can be returned in the Status argument of *MessageWrapperAck*:

Value	Description
TargetNodeId	The Logical Node ID of the device using this message.
PayloadSize	The payload size in bytes. If this is a NACK, then PayloadSize is zero.
Payload	The response from the CSP to the tunneled message.
0x10	If WaitForAck was non-zero, then this response value means that an ack was received within the specified timeout period. If WaitForAck was zero (do not wait) then 0x10 means the message was delivered to the device. A positive response does not imply that the tunneled message was successful, only that it was delivered successfully. The payload may contain a NACK.
SK_INVALID_NODE	TargetNodeId does not exist or is not LINK_UP
SK_NO_ACK_FROM_SWITCH	Timeout occurred while LLC was waiting for an acknowledgment to the tunneled message.

C Structure typedef struct {

```

        BaseFields Base;
        unsigned short TargetNodeId;
        UBYTE WaitForAck;
        UBYTE PayloadTimeout;
        unsigned short PayloadSize;
        UBYTE Payload[247];
    } XL_MessageWrapper;

```

C Structure Response

```

C-Structure
typedef struct {
    BaseFields Base;
    unsigned short Status;
    UBYTE reserved6[13];
    unsigned short TargetNodeId;
    unsigned short PayloadSize;
    UBYTE Payload[247];
} XL_MessageWrapperAck;

```

C++ Class

```

class XLC_MessageWrapper: public XLC_OutboundMessage {
    unsigned short getTargetNodeId() const;
    void setTargetNodeId(unsigned short x);
    UBYTE getWaitForAck() const;
    void setWaitForAck(UBYTE x);
    UBYTE getPayloadTimeout() const;
    void setPayloadTimeout(UBYTE x);
    unsigned short getPayloadSize() const;
    void setPayloadSize(unsigned short x);
    const UBYTE *getPayload() const;
    UBYTE *getPayload();
    void setPayload(UBYTE *x);
};

```

C++ Class Response

```

class XLC_MessageWrapperAck: public
    XLC_AcknowledgeMessage {
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    unsigned short getTargetNodeId() const;
    void setTargetNodeId(unsigned short x);
    unsigned short getPayloadSize() const;
    void setPayloadSize(unsigned short x);
    const UBYTE *getPayload() const;
    UBYTE *getPayload();
    void setPayload(UBYTE *x);
};

```

Limitations There is no way to tunnel to an application an unsolicited CSP message. The application must continue to register to receive these.

socket.log In the socket.log, messages that have been tunneled will be displayed with an asterisk preceding the bytes.

Example of an outbound message:

```
Apr 01 2002 13:44:22 H->X2[10.10.158.16] * : 01 01 00 00
    fe 00 02 52 02 00 02 53 04 00 20 00 01 02
```

Example of an inbound message:

```
Apr 01 2002 13:44:22 X2[10.10.158.16]->H * : 01 01 00 00
    fe 00 10 00 02 52 02 00 02 53 04 00 20 00 01 07 00 05
    00 02 00 03 00 08 00 02 01 01 00 07 00 02 00 01 00 0a
    00 04 00 05 00 05 00 0c 00 06 0a 0a 9e 07 31 51 00 0d
    00 06 00 00 00 00 00 00 00 0e 00 02 00 01
```

LLC message validation

The LLC will make no attempt to validate the contents of the payload. Since the CSP will not NACK ill formed messages (it generates an alarm instead) the likely response will be SK_NO_ACK_FROM_SWITCH.

Example Code This code example sends an IP Signaling Series 3 Card Query message (0x101) to a device server with a node id of 0x02:

```

UBYTE sqbuf[] = {
    0x00, 0x13, //length
    0x01, 0x01, // tag
    0x00, //reserved
    0x00, // seq num
    0xfe, // ELNI
    0x00, // address method
    0x02, // num address elements
    0x52, 0x02, 0x00, 0x02, // ELNI
    0x53, 0x04, 0x00, 0x20, 0x00, 0x01, // ObInstId
    0x02, // query type
    0x00 //reserved
};

```

```

XLC_MessageWrapper sq(sizeof(sqbuf)+0x20);

```

```

sq.setPayloadSize(sizeof(sqbuf));
memcpy(sq.getPayload(), sqbuf, sizeof(sqbuf));
sq.setTargetNodeId(0x02);
sq.setWaitForAck(1);
sq.setPayloadTimeout(0x10);
sq.send();

```

This code example is from the handler function for this message:

```

CASEC_MessageWrapperAck(mwa)
{
    cout << "ACK: " << hex << mwa->getStatus() << endl;
    cout << "    Payload size: " << mwa->getPayloadSize() << endl;
    cout << "    Payload: ";

    if (mwa->getStatus() == 0x10)
    {
        for (int x = 0; x<mwa->getPayloadSize(); x++)
        {
            cout << hex << (int)mwa->getPayload()[x] << " ";
        }
        cout << endl;
    }
    return OK;
}

```

MonitorChannel

Type	SwitchKit API message
Description	This message is used by the function sk_monitorChannel() in case an application makes a monitoring call.
Sent by	Function sk_monitorChannel()

Multi-Host Configure 0x00E9

SwitchKit Name MultiHostConfig

Type EXS API and SwitchKit API message

Description **Multi-Host Configure 0x00E9**

Use this message to register a host to receive or not receive specific API messages, as well as the PPL components for which *PPL Event Indication* messages are sent by the CSP. You also use this message to query the registration status for a specific host.

Note the following:

- You can only send one ICB subtype per message.
- Multi-Host Control is disabled by default. You enable it with Action ICB Subtype 0x33.

Definitions

Hard Register - CSP-initiated messages or *PPL Event Indications* messages will be received by the host regardless if any other hosts are receiving it.

Soft Register - CSP-initiated messages or *PPL Event Indications* messages will be received by the host only if the messages are not destined for any other host, either by none registering for them or by the registered host(s) not having socket connectivity.

De-register - CSP-initiated messages or *PPL Event Indications* messages will not be received by the host under any circumstances.

PPL-Component IDs - PPL-component IDs are a sub-field in the *PPL Event Indication* message. Registration for these IDs will cause the *PPL Event Indication* message with this ID as a sub-field to be sent to the registered host. To receive all *PPL Event Indication* messages, a host should register for the *PPL Event Indication* message itself, and not use the PPL-component ID registration.

Sent by Host

SwitchKit Code **Configuration**

```
MultiHostConfig (
    Node = integer,
    Data = byte array);
```

C Structure

```
typedef struct {
    UBYTE Data[253];
} XL_MultiHostConfig;
```

C Structure Response

```
typedef struct {
    tus;
    UBYTE Data[251];
} XL_MultiHostConfigAck;
```

C++ Class

```
class XLC_MultiHostConfig : public XLC_OutboundMessage {
public:
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

C++ Class Response

```
class XLC_MultiHostConfigAck : public
    XLC_AcknowledgeMessage {
public:
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

NGA Service Configure 0x0160

SwitchKit Name NGAServiceConfigure

Type **NGA Service Configure 0x0160**
 EXS and SwitchKit API message

Description Changes the service state for the M3UA object.

Sent by Host application

NGA Service Query 0x0161

SwitchKit Name NGAServiceQuery

Type EXS and SwitchKit API message

Description **NGA Service Query 0x0161**

Queries the objects for their service state. The service state is the state that the user put the object into. For example, if the user put a link in service but the link is not physically connected, the service state is *In Service*

Sent by Host application

NGA State Query 0x0162

SwitchKit Name NGAStateQuery

Type EXS and SwitchKit API message

Description **NGA State Query 0x0162**

Queries the M3UA objects for their actual state status. Do not confuse with the Service State Query. The following example shows the difference. If the user puts a link in service but the link is not physically connected, the service state is *In Service* but the state status is *Out of Service*.

Outputpulse Digits 0x0020

SwitchKit Name OutputpulseDigits

Type EXS API and SwitchKit API message

Description **Outputpulse Digits 0x0020**

This message instructs the CSP to outputpulse up to two strings of digits to the specified channel. The strings may be in BCD or non-BCD format.

Using non-BCD format allows the host to insert silence between the outputpulsing of digits by inserting delay digits (0x10) within the digit string. When a delay digit is encountered in a digit string, the DSP providing the outputpulsing will transmit silence for the delay duration. The delay duration is configured by the host in this message. Delay digits may be grouped to provide dynamic delay durations.

Sent by Host

6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
:	AIB Address Method 0x00 - Individual AEs Number of AEs to follow AE 0x0D Channel	8, 9	Status (MSB, LSB)
:	Signal Type 0x01 DTMF 0x02 MFR1	10	Checksum
:	String Count Number of digit strings to be outpulsed (0x01–0x02)		
:	String Format 0x00 BCD (two digits per byte, delay digits not valid) 0x01 Non-BCD (one digit per byte, delay digits valid)		
:	String Mode This field is valid only if signal type is MFR1. (Set to 0x00 for DTMF) 0x00 The CSP will insert KP and ST framing digits. 0x01 The host will insert framing digits.		
:	First Digit Duration MSB, LSB This field is valid only if signal type is MFR1. (Set to 0x00 for DTMF) A two-byte field identifying the length of time to outpulse the KP signal. The typical duration is 100 ms (0x000A).		
:	Digit Duration MSB, LSB A two-byte field identifying the length of time to outpulse the digits. The typical duration is 80 ms (0x0008).		
:	Interdigit Duration MSB, LSB A two-byte field identifying the length of time to wait between each outpulsed digit. The typical duration is 80 ms (0x0008).		
:	Delay Duration MSB, LSB A two-byte field identifying the length of time to wait when the delay digit (0x10) is encountered in the digit string. The typical duration is 40 ms (0x0004); it should not be less than 20 ms (0x0002). When determining the delay duration, keep in mind that the inter-digit duration will apply between digit delays.		
:	Generate Event Flag 0x00 Do not inform host when outpulsing complete 0x01 Inform host when outpulsing complete with a Call Processing Event message specifying event type as "outpulsing complete."		

Outpulse Digits 0x0020

:	String 1 Digit Count Number of digits in string to follow (0x01–0x64). This message allows for 100 bytes of digit data which means: if the host specifies string format as BCD, it may outpulse two BCD strings of length 100 each, and if the host specifies string format as Non-BCD, it may outpulse one string of 100 digits, or two strings with the sum of digits in both strings equal to 100.
:	String 1 Digits (See table below)
:	:
:	String 2 Digit Count
:	String 2 Digits
:	:
	Refer to <i>Interworking TLVs (4-4)</i> if you have enabled interworking from the <i>VoIP Protocol Configure 0x00EE</i> message.

Outseize Control 0x002C

SwitchKit Name OutseizeControl

Type EXS API and SwitchKit API message

Description **Outseize Control 0x002C**

Use this message to control outgoing call setup during real-time call processing on the specified channel. Instructions and data are passed in the form of Information Control Blocks (ICBs).

You can preprogram a list of instructions using the *Outseize Instruction List Configure* message and initiate them by sending the *Outseize Control* message with an ICB of "Use Instruction List." Note the seize instruction cannot be pre-programmed.

An instruction that is not carried out reports a negative Acknowledgment. A positive acknowledgment is reported only if an Action ICB of "Send Host Acknowledgment" is included in the message.

Contact Dialogic Technical Support if you want to send an *Outseize Control* message greater than 512 bytes.

ISDN PRI and SS7

Outseize instructions cannot be preprogrammed for ISDN PRI or SS7 channels. You must include all outseize instructions for ISDN PRI and SS7 in the *Outseize Control* message.

For an SS7 channel, this message results in an IAM being sent to the network. Mandatory parameters must be included in an SS7 Parameters ICB.

:	<p>ICB</p> <p>NOTE: For an SS7 channel in ANSI ISUP CRM/CRA, the <i>Outseize Control</i> message must include an SS7 Parameters ICB. This allows a CRM message type to be part of the SS7 Parameter ICB that is sent in the <i>Outseize Control</i> message. To send an IAM message after an <i>Outseize Control</i> message with CRM, a separate <i>PPL Event Request</i> for IAM must be made.</p> <p>0x01 Action</p> <ul style="list-style-type: none"> 0x00 Null* 0x01 Scan For Wink N 0x02 Scan For ANI Request Off-hook* 0x03 Scan For Dial Tone* 0x04 Report Call Processing Event 0x05 Outpulse Stage N Address Data 0x06 Wait For Host Address Data* 0x07 Wait For Host Control* 0x08 Send Host Acknowledgment * (the ISDN PRI card ignores the Send Host Acknowledgment) 0x09 Do Call Progress Analysis (T-ONE calls only) 0x0A Seize (see Note 3)* 0x0B Use Instruction List 0x0C Reserved* 0x0D Cancel R2 Receiver* 0x0E Scan For Backward R2 Signal* 0x0F Wait For Host Control With Answer Supervision (see Note 4)* 0x10 Do Call Progress Analysis Without Line Signaling 0x11 Delay N Milliseconds <p>0x02 Data</p> <ul style="list-style-type: none"> 0x01 Stage N Address Data 0x02 Stage N Address Data 0x10 ISDN Formatted IEs 0x11 ISDN Raw IEs 0x12 SS7 Parameters 0x15 DASS2/DPNSS Raw Data 0x1C SS7 TUP Formatted Fields 0x1E Generic PPL 0x25 ISDN Segmented Message 0x66 SS7 Address Information <p>0x03 Extended Data</p> <ul style="list-style-type: none"> 0x0012 SS7 Formatted Parameters 0x0033 NPDI Universal ICB 0x001E Generic PPL <p>* The ICB has no data, so you will always use 0x00 for the value of the Data Length field.</p>
:	Checksum

Notes:

1. When the system outpulses BCD-encoded digits, a Stage N Address Data ICB must accompany the digits to define the outpulsing parameters. The position of the Data ICB is not critical.
2. The host must have a DSP configured for Call Progress Analysis for a “Do Call Progress Analysis” ICB to be invoked. For more information, refer to the message *DSP SIMM Configure* (0xC0)
3. A seize instruction, when present, must be the first Action ICB. A seize instruction cannot be included in a preprogrammed outseize instruction list.
4. If Answer Supervision Mode is configured for “Notify” or “Notify and Propagate,” the host will be informed with a Call Processing Event message of “Answer.” Note that the default Answer Supervision Mode is “Propagate.”

Outseize Instruction List Configure 0x002A

SwitchKit Name OuseizeInstrListConfig

Type EXS API and SwitchKit API message

Description **Outseize Instruction List Configure 0x002A**

Use several of these messages to preprogram a list of instructions for outseize control on CAS channels. You must send a separate *Outseize Instruction List Configure* message for each instruction that you add to the list.

Outseize instructions cannot be preprogrammed for ISDN PRI or SS7 channels. You must include all outseize instructions for ISDN PRI and SS7 in the *Outseize Control* message.

After configuring a channel with an Outseize Instruction List, the CSP uses the list to initiate an outseizure on a channel. You set this up by sending an *Outseize Control* message with a “Use Instruction List” ICB.

The last instruction in a list should always be “Wait For Host Control” or “Wait for Host Control with Answer Supervision,” where the CSP waits for further instructions from the host to continue processing.

NOTE: A seize instruction *cannot* be preprogrammed.

2. Outpulse Stage 2 Digits
3. Outpulse Stage 3 Digits
4. Outpulse Stage 4 Digits
5. Report Call Processing Event
6. Wait For Host Control Message

PCM Encoding Format Configure 0x00D9

SwitchKit Name PCMEncodingConfig

Type EXS API and SwitchKit API message

Description **PCM Encoding Format Configure 0x00D9**

This message allows the host to set the PCM (pulse code modulation) encoding format of a channel to A-law or μ -law on T1 or E1 spans.

If an A-law encoded channel is connected to a μ -law encoded channel, the CSP performs the necessary conversion between the two channels to allow the appropriate voice data to be transmitted to both listeners.

Channels on E1 line cards default to A-law encoded format.

When you configure SS7 with an ANSI stack over an E1 Card, you must send the PCM Encoding Format Configure message with the PCM encoding format set to A-law **after** you send the SS7 Signaling Stack Configure (0x5C) message. The SS7 Signaling Stack Configure message overwrites the PCM Encoding Format Configure message.

Channels on T1 line cards default to μ -law encoded format.

When you configure SS7 with an ITU stack over a T1 Card or you configure Euro-ISDN over T-1, you must send the PCM Encoding Format Configure message with the PCM encoding format set to μ -law **after** you send the SS7 Signaling Stack Configure or the ISDN Interface Configure (0x60) messages. The ISDN Interface Configure message overwrites the PCM Encoding Format Configure message.

Occasionally, as in the case of a raw 8-bit data pipe connection, encoding conversion must be disabled. To do so, use this message to set both sides of the connection to the same PCM encoding format and no conversion will be performed.

Park Channel 0x00BF

SwitchKit Name ParkChannel

Type EXS API and SwitchKit API message

Description **Park Channel 0x00BF**

This message is used to park one or both channels involved in a connection. This message disconnects two parties but does not tear down the connection.

To park only one channel, enter the channel to be parked as both Channel A and Channel B in the AIB. When a channel is parked, it is not associated with any other channel and silence is transmitted to it. The channel may be used in a subsequent connection or released.

When parking two channels, the host will receive a positive acknowledgment to this message for the first channel and a *DSO Status Change* message with a channel status of “parked” for the second channel.

Sent by Host

Play File Modify 0x011C

SwitchKit Name PlayFileModify

Type EXS API and SwitchKit API message

Description **Play File Modify 0x011C**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to modify a current play file session. You can modify the gain and speed of the playback, pause or resume the playback, or skip forward or backward (in 100 ms increments) through the current file.

When modifying a file that is playing to a conference, use the Conference AIB instead of the Channel AIB. If you are modifying a file that is playing to a conference, use the optional File ID TLV. If you use the File ID TLV, all instances of that File ID being played in the specified conference are modified. If the File ID TLV is absent, all the files playing into that conference are modified.

Play File Start 0x011B

SwitchKit Name PlayFileStart

Type EXS API and SwitchKit API message

Description **Play File Start 0x011B**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to start playing a file.

You can either specify the channel and the DSP Series 2 card, or let the CSP Matrix Series 3 Card choose the DSP card by leaving the DSP slot set to 0xFF. The CSP Matrix Series 3 Card reports back which DSP Series 2 card has been selected.

If you are accessing files from an external server, you must send the *Generic Card Configure* message (0x0122) to set the Vocabulary Index File before you send this message, because you must identify a file's ID and location before you can play it. Internal recordings are an exception to this rule. Internal recordings can be played without having their IDs in the Vocabulary Index File.

The *Play File Start* message may use File IDs from 0x00 to 0xFFFFFFFF. 0xFFFFFFFF is reserved by Dialogic for internal use, except when using media streaming over RTP, when the range is up to 0x0100000.

When recording a conference or playing a file to a conference, use the Conference AIB instead of the Channel AIB.

Sent by Host Application

Play File Stop 0x011D

SwitchKit Name PlayFileStop

Type EXS API and SwitchKit API message

Description **Play File Stop 0x011D**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to end a current play file session. The message may be used to cancel only play file requests that were made with the new *Play File Start* message.

If you are stopping a play file to a conference (using the Conference ID AIB) you can use the File ID TLV. If File ID TLV is present, all instances of that file ID being played in the specified conference are stopped. If the File ID TLV is absent, all the files playing into that conference are stopped.

Poll 0x00AB

SwitchKit Name	PollMessage
Type	EXS API and SwitchKit API message
Description	<p>Poll 0x00AB</p> <p>This message is sent by each CSP Matrix Series 3 Card to the host periodically, according to the poll interval.</p> <p>This message is also sent by each SS7 card (active and standby) to the SS7 local host periodically, according to the poll interval when interfaced by TCP/IP connections.</p> <p>The default interval for the CSP Matrix Series 3 Card is 2 seconds; it can be changed using the <i>Poll Interval Configure</i> message.</p> <p>The default interval for the SS7 card is 2 seconds; it can be changed using the <i>Poll Interval Configure</i> message.</p> <p>A <i>Poll</i> message is sent every time a state transition occurs. On transitions to the boot state, the poll may be delayed while the matrix or SS7 card resets. Every <i>Poll</i> message indicates the most recent matrix or SS7 card state transitions.</p> <p>The information in the <i>Poll</i> message is used by the host to detect that a matrix is attached to the host and that the communication link is functional. In a redundant system, information about the adjacent matrix or SS7 card state is also included. The host must use this information to properly communicate with the system.</p> <p>The ACK to this message can go to the standby CSP Matrix Series 3 Card.</p>

3, 4	Message Type (0x00AB)	3, 4	Message Type (0x00AB)
5	Reserved (0x00)	5	Reserved (0x00)
6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
8, 9	Status MSB, LSB The status is always 0x0010	8	Checksum
10	System Type 0x01 CSP 2090 0x03 CSP 2040 0x04 - EXNET Connect 0x80 SS7 card (both PQ and Series 3)		
11	Data The data varies, depending on the Poll source. The following data is reported if the Poll source is an CSP Matrix Series 3 Card, EXNET-ONE card, or EXNET Connect® card. Data[0] Card ID This field indicates the CSP Matrix Series 3 Card that is polling. 0x00 Right CSP 2000 Matrix (Slot 0x20) 0x01 Left CSP 2000 Matrix (Slot 0x21) Data[1] Card State This field indicates the most recent matrix state. 0x01 Booting 0x02 Initializing 0x03 Standby 0x04 Switching Over 0x05 Active		

Data[2] Adjacent Card State

This field indicates the most recent adjacent CSP Matrix Series 3 Card state change.

Changes in the adjacent CSP Matrix Series 3 Card state should be considered as events at the host.

- 0x00 No adjacent CSP Matrix Series 3 Card detected.
- 0x01 Adjacent CSP Matrix Series 3 Card detected, cannot establish inter-matrix communications.
- 0x02 Adjacent CSP Matrix Series 3 Card detected, inter-matrix communications established, and adjacent CSP Matrix Series 3 Card cannot establish communications with the host.
- 0x03 Adjacent CSP Matrix Series 3 Card detected, inter-matrix communications established, and adjacent CSP Matrix Series 3 Card communicating with host.

Data[3] Card Status

This field is a bit mask. The meaning of each bit is as follows:

- Bit 0 Host Messaging
 - 0 Receiving messages from host (at least 1 per 5-second interval)
 - 1 Not Receiving messages from the host
- Bit 1* Download
 - 0 Download not required
 - 1 Download required
- Bit 2 Active Ethernet Interface
 - 0 Interface 1 Active
 - 1 Interface 2 Active
- Bit 3 Configuration
 - 0 Ready for configuration messages
 - 1 Not ready for configuration messages
- Bit 4 Reserved
- Bit 5 TFTP Download
 - 0 Not In Progress
 - 1 In Progress
- Bits 6-7 Reserved

* If the CSP Matrix Series 3 Card has system software, or if it can obtain it from the adjacent CSP Matrix Series 3 Card, Bit 1 is "0". If Bit 1 is set, the host initiates a download of the system software. In some circumstances, both CSP Matrix Series 3 Card cards indicate that they require system software to be downloaded. The CSP Matrix Series 3 Card that receives its *Download Complete* message last will become the active CSP Matrix Series 3 Card.

Data[4, 5] Reserved

Data[6, 7] Multi-Host Connection Status

This field is a bit mask indicating the connection status of each host according to the previous *Poll* message sent by the CSP. If the *Poll* message was acknowledged by a specific host port, the corresponding bit is set to 1. If the *Poll* message was not acknowledged by a specific host, the corresponding bit is set to 0.

NOTE: Polling is operational only when the host is connected to Host Port 3142 and polling is enabled.

Status

- 0 - no *Poll* ACK received
- 1 - *Poll* ACK received

<u>Bit Number</u>	<u>Host Port Number</u>
Byte 1	
1 (Low Bit)	0x3142
2	0x3143
3	0x3144
4	0x3145
5	0x3146
6	0x3147
7, 8	Reserved (0)
Byte 2	
9-16	Reserved (0)

<p><u>The following data is reported if the Poll Source is an SS7 card:</u></p>	
	Data[0] Slot Number
	Data[1] Card State
	0x01 Booting or Unknown
	0x02 Synchronizing
	0x03 Standby
	0x04 Reserved
	0x05 Active or Single State

8	Poll Interval 0x00 Disable Polling (except when a CSP Matrix Series 3 Card state transition occurs) If Host Link Failure Detection is enabled, you must disable it using the <i>System Configuration</i> message before polling is actually disabled. 0x01–0xFF The number of seconds for the polling interval, in tenths of seconds (the maximum polling interval is 25.5 seconds). The poll interval remains set after a reset, but must be reset if the CSP Matrix Series 3 Card powered down.		
9	Checksum		

Poll Request 0x009E

SwitchKit Name PollRequest

Type EXS API and SwitchKit API message

Description **Poll Request 0x009E**

Use this message to initiate the sending of a *Poll* message from the CSP Matrix Series 3 Card or SS7 card to the host. The host may use this message to implement its own polling scheme, or to obtain information from the CSP Matrix Series 3 Card or SS7 card.

The host can send this message to the active or standby CSP Matrix Series 3 Card.

PPL Audit Query 0x00DD

SwitchKit Name PPLAuditQuery

Type EXS API and SwitchKit API message

Description **PPL Audit Query 0x00DD**

The host uses this message to request an audit for individual PPL components or entities. The CSP maintains two logs: the PPL state transition log and the PPL error log. Therefore, the host can use this message for two types of audits:

1. PPL State Transition audit
This audit retrieves information on a per-instantiated PPL component basis.
2. PPL Error audit
This audit retrieves information on a per-card basis.

The response to this message is the PPL audit. Its contents, including the length of the audit entry, varies per PPL component.

PPL component audits consist of one or more audit blocks, which in turn are made up of one or more audit entries. Each one of these messages queries one audit block. In order to audit a PPL component completely, the host must send several of these messages.

When there are no audit entries remaining, the response status to the *PPL Audit Query* message will indicate 0x00D7 (End of PPL Audit Data).

Prior to using this message, you must enable auditing using the *PPL Audit Configure* message.

State Status

This byte indicates whether or not a blocking atomic function has been invoked by the state machine. A blocking atomic function is used for allocation of any off-board service resource required by the PPL. Once the result of the resource request is received, the channel unblocks and resumes the remainder of the primitive. Blocking is performed on a channel basis without affecting other channels.

- 0x00 Normal
- 0xFF Blocking

Timestamp

The timestamp is an incrementing 10 ms timer representing the relative time between PPL events. After reaching the value of 0xFFFF, the timer resets to zero.

PPL Error Status

Valid entries for this word-length field are as follows:

- 0x0000 No Error
- 0xF448 Invalid event for next state
- 0xF447 Invalid event for initial state
- 0xF446 Blocked message
- 0xF445 Blocked event
- 0xF444 Invalid event for blocked state
- 0xF443 Internal error (wrong task ID)
- 0xF442 Internal error (invalid header)
- 0xF441 Internal error (invalid header)
- 0xF440 Invalid event
- 0xF43E Timer is disabled
- 0xF43D Timer expired out of sequence
- 0xF43C Event not processed
- 0xF43B Internal error (invalid message)

- 0xF43A Cannot create new context
- 0xF439 Cannot enter new context
- 0xF438 Entering new context
- 0xF437 Leaving new context
- 0xF436 Invalid context
- 0xF435 No state/event list
- 0xF434 State machine suspended
- 0xF433 Timer expired while in blocked state
- 0xF432 Invalid response to blocked state
- 0xF431 Not waiting on internal event
- 0xF430 Initiated Channel purge
- 0xF42F Maximum iterations of state machine exceeded
- 0xF42E Null primitive
- 0xF42D Context is inconsistent
- 0xF42C Maximum nesting level exceeded
- 0xF42B Initiated state machine reset
- 0xF42A Maximum config byte offset exceeded
- 0xF429 Maximum number of GPRs exceeded
- 0xF420 Block Invalid Events
- 0xF41F Invalid Event Handler Activated

Example Message

This example shows a *PPL Audit Query* message that is being used to query a PPL State Transition audit log on logical span 0/channel 0, ISDN component #5. The message from the host to the CSP is as follows:

Header:

fe [00 16] [00 dd] 00 00 ff

AIB:

00 01 0D 03 00 00 00

Info:

[00 05] 00 00

MESSAGE		
Byte	Field Description	Value and Indication
0	Frame	0xFE
1	Length (MSB, LSB)	0x0016 (22)
2		
3	Message Type (MSB, LSB)	0x00DD (PPL Audit Query)
4		
5	Reserved	0x00
6	Sequence #	0x00

7	Logical Node ID	0xFF
8	AIB	0x00 (Single Entity)
9	Number of Address Elements	0x01
10	Address Type	0x0D (Channel)
11	Data Length	0x03
12	Logical Span (MSB, LSB)	0x0000 (Span 0)
13		
14	Channel	0x00 (Channel 0)
15	PPL Component ID (MSB, LSB)	0x0005 (ISDN L3P Call Reference)
16		
17	Audit Type	0x00 (PPL State Transition Audit)
18	Audit Block	0x00 (Block 0)
19	Checksum	0xC5 (does not appear in trace)

The trace of the response shows that 14 bytes of data are returned for each of nine audits on the specified channel/PPL component. The response, containing the log information, is as follows:

Header:

fe [00 92] [00 dd] 00 15 ff [00 10]

AIB:

00 01 0d 03 00 00 00

Info:

[00 05] 00 00 0f 09

NOTE 1 The following information shows calculations for the *number* of bytes in the Data, Start/End Range, and Mask fields. The actual data within these bytes varies.

1. Convert Criteria Data Length to decimal value.
2. If Route Property = 0x01
 - a = number of bytes in Data = Criteria Data Length / 2
 - b = number of bytes in Mask = Criteria Data Length / 2
3. If Route Property = 0x02,
 - x = number of bytes in Start Range = Criteria Data Length / 3
 - y = number of bytes in End Range = Criteria Data Length / 3
 - z = number of bytes in Mask = Criteria Data Length / 3

NOTE 2 The following information shows calculations for the *number* of bytes in the Data, Start/End Range, and Mask fields. The actual data within these bytes varies.

1. Convert Criteria Data Length to decimal value.
2. If Route Property = 0x01
 - a = number of bytes in Data = (Criteria Data Length – 6) / 2
 - b = number of bytes in Mask = (Criteria Data Length – 6) / 2
3. If Route Property = 0x02,
 - x = number of bytes in Start Range = (Criteria Data Length – 6) / 3
 - y = number of bytes in End Range = (Criteria Data Length – 6) / 3

$$z = \text{number of bytes in Mask} = (\text{Criteria Data Length} - 6) / 3$$

If the response data cannot be sent by the CSP in one message, you must resend the message, incrementing the range, until a response status of 0xD7 is returned.

Criteria Type entries

0x0001 Address Digits 1
0x0002 Address Digits 2
0x0003 Address Digits 3
0x0004 Address Digits 4
0x0005 User-defined
0x0006 Route Group ID
0x0007 Incoming Span/Channel
0x0010 Incoming Resource Group
0x001A Incoming Node ID

Universal Protocol Data

A Universal Protocol is one of the options that can be used when defining a particular Criteria Type. You must distinguish between UDP and other possible entries to accurately show the data contained in the Route Tables.

0x09CE Build Index Table
0x2718 Calling Party Number (Connected Number)
0x27B0 RTP Payload Type
0x2792 Source IP Address
0x2792 Source IP Address
0x2793 Source RTP Port
0x2794 Destination IP Address
0x2795 Destination RTP Port
0x27B0 RTP Payload Type
0x27B1 RTP Payload Size

PPL Delete 0x00DA

SwitchKit Name PPLDelete

Type EXS API and SwitchKit API message

Description **PPL Delete 0x00DA**

This message allows the host to delete a protocol, a primitive table, or a state/event table. A primitive or state/event table is not be deleted if it is associated with a protocol in use. All channels must be out-of-service.

If the host sends this message to a CSP that has multiple line cards of the same type, the system deletes the protocol only if the protocol is not in use by every card. If the PPL protocol is in use by at least one card, the system returns a *Channel In Service* (0xD5) response and does not delete the channel.

You can delete all downloaded PPL components by specifying the PPL component 0xFFFF, which is valid for this message only. Using this value has the following effects:

- For E1 and T1 cards and matrices (L4PPL), the system deletes all downloaded PPLs and purges all channels using non-default protocols.
- For ISDN and SS7 cards, the system deletes all downloaded PPLs. If any channel (D/B channel, SS7 link, and so on) is using a non-default protocol *and* is in service, the system resets the card; however, if no channels are in service, the system does not reset the card.

Sent by Host

SwitchKit Code **Configuration**

```
PPLDelete (
    Node = integer,
    ComponentID = integer,
    Entity = integer,
    EntityID = integer);
```

C Structure

```
typedef struct {
    unsigned short ComponentID;
    UBYTE Entity;
    UBYTE EntityID;
} XL_PPLDelete;
```

C++ Class

```
class XLC_PPLDelete : public XLC_OutboundMessage {
public:
    unsigned short GetComponentID() const;
    void setComponentID(unsigned short x);
    UBYTE getEntity() const;
    void setEntity(UBYTE x);
    UBYTE getEntityID() const;
    void setEntityID(UBYTE x);
```

};

PPL Event Indication 0x0043

SwitchKit Name PPLEventIndication

Type EXS API and SwitchKit API message

Description **PPL Event Indication 0x0043**

This message is sent by a PPL component to report an event to the host with optional ICB data.

NOTE: All PPL Event Indication messages that originate with the CIC PPL component will have the new Virtual CIC AIB.

Sent by CSP

Example Message (Socket Log Output for SwitchKit)

In this example, the CSP informs the host of an incoming SIP REGISTER message:

```
00 0B 00 43 00 00 FF 7F 00 A7 00 0A 00
```

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE AddrInfo[30];
    unsigned short ComponentID;
    unsigned short PPLEvent;
    UBYTE ICBCount;
    UBYTE Data[218];
} XL_PPPEventIndication;
```

C++ Class

```
class XLC_PPPEventIndication : public XLC_InboundMessage
{
public:
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    XBYTE getSpan() const;
    void setSpan(XBYTE x);
    UBYTE getChannel() const;
    void setChannel(UBYTE x);
    UBYTE getStackID() const;
    void setStackID(UBYTE x);
    UBYTE getLinkID() const;
    void setLinkID(UBYTE x);
    XBYTE getV5ID() const;
    void setV5ID(XBYTE x);
    unsigned short getComponentID() const;
    void setComponentID(unsigned short x);
    unsigned short getPPLEvent() const;
    void setPPLEvent(unsigned short x);
    UBYTE getICBCount() const;
    void setICBCount(UBYTE x);
```

```
const UBYTE *getData() const;
UBYTE *getData();
void setData(UBYTE *x);
};
```

Data For SS7 MTP Message Tracing:

ICB Data Length n (variable)

Data [0]First byte of MSU Data

Data [n]End of MSU Data

NOTE: If ICB length is more than 200 bytes the following applies.
 For example: ICB Data Length is 450 bytes:

- a. Then the first frame will be sent with the first 200 bytes of MSU Data with PPL Event Indication as 0x20: "SS7 MTP Message Tracing Not Last".

- b. The second frame will be sent with the next 200 bytes of MSU Data with PPL Event Indication as 0x20: "MTP Message Tracing Not Last".
- c. The third frame will be sent with the next 50 bytes of MSU Data with PPL Event Indication as 0x21: "MTP Message Tracing Last".

The length and content of the data varies according to the ICB subtype. A list of valid ICBs appears in the *ICB* chapter.

Response Status

If the MSB of the Status field is 0x50 (NACK), the LSB indicates the NACK reason.

0x01 Invalid module type for DPC/Stack/CICcombination.

Example: Host has sent a *Service State Configure* message with invalid DPC/Stack/CIC.

0x02 Message received for unassigned CIC.

Example: Host has sent a *PPL Event Request* for unassigned CIC.

0x03 Only Extended API is supported for VCIC.

PPL Event Request 0x0044

SwitchKit Name	PPLEventRequest

Primitive Table Format (0x01)

A Primitive Table is a set of primitives used in conjunction with a State/Event Table to create a PPL protocol. Each Primitive Table can contain up to 400 primitives. The Primitive Table is assigned to the protocol when the protocol is created with the *PPL Create* message.

The Primitive Table format is shown in the table below.

Byte	Field Description	Definition
Message Header		
8, 9	PPL Component ID (MSB, LSB)	See list of Component IDs in this document.
10	Table Type	0x01 Primitive Table
11	Table ID	Assigned by host.
Table Data		
12, 13	Data[0,1] Primitive ID (MSB, LSB)	Identifies each primitive in the primitive table. Each primitive in the table must be unique, and in the range from 0 to 199. The primitives in the table must be ordered lowest number to highest (numbers may be skipped).
14	Data[2] Number of AFs	The number of AFs used to create the primitive (1 to 10).

15, 16	Data[3,4] AF: ID (MSB, LSB)	The AF ID specifies the predefined function to be invoked (in the range supplied by Dialogic).
17, 18	Data[5,6] Arg 1 Value (MSB, LSB)	The first argument value to pass to the AF.
19, 20	Data[7,8] Arg 2 Value (MSB, LSB)	The second argument value to pass to the AF.
Repeat Data[3-8] for each AF in the primitive.		
:	Checksum	

Basic State/Event Table Format (0x02)

A Basic State/Event table is a group of valid events that pertain to a given state, the primitives that get invoked upon the occurrence the event, and the next state to transition into in response to the event(s). State/event tables allow for up to 100 states and up to 20 events per state. The Primitive Table is assigned to the protocol when the protocol is created with the *PPL Create* message.

The Basic State/Event Table format is shown in the table below.

Byte	Field Description	Definition
Message Header		
8, 9	PPL Component ID (MSB, LSB)	See list of Component IDs in this document.
10	Table Type	0x02 Basic State/Event Table
11	Table ID	Assigned by host
Table Data		
12	Data[0] Table Data Initial State Number	Identifies the current state that the protocol is in. States must be specified in order from 1 to 199. State numbers can be skipped. The initial State Type is assumed to be Normal.
13	Data[1] Number of Events	The number of valid events accepted by the state. Each state can accept up to 120 events. For best performance, events most likely to occur should be placed at the beginning of the list.
14, 15	Data[2, 3] Event 1 # (MSB, LSB)	See the for event data.
16, 17	Data[4, 5] Event Data 1 Value (MSB, LSB)	
18, 19	Data[6, 7] Event Data 2 Value (MSB, LSB)	
20, 21	Data[8, 9] Primitive ID (MSB, LSB)	The primitive invoked when the specified event occurs based on the Primitive Table associated with the event.
22	Data[10] Next State Number	The state that the protocol should enter in response to the indicated event(s).
23	Data[11] Next State Type	0x01 Normal/Wait 0x02 Internal
Repeat Data[2-11] for each event associated with the state.		
:	Checksum	

Route Table (0x03) The Route Table format is shown in the table below.

Byte	Field Description	Definition
Message Header		
8, 9	PPL Component ID (MSB, LSB)	See PPL Information chapter in <i>API Reference</i> .
10	Table Type	0x03 Route Table
11	Table ID	Assigned by host
Table Data		
12, 13	Data[0, 1] Route Number	Index into the Route Table
14	Data[2] Route Property	This field is a bit mask indicating the details about the format of the remaining message bytes. <u>Bit</u> 0-4 Not used 5 Force the storage of entry in Sequential Linked List. If not set, use the default method of storage. 6 If set, use exact matching. If cleared use default method of matching 7 Version of Route Table. Should always be set.
15	Data[3] Route Property - Addressing method	This field is a bit mask indicating the addressing method, either single or range. <u>Bit</u> 0 Single 1 Range
16, 17	Data[2, 3] Version	Currently version 0x0001.
18, 19	Data[4, 5] Route Group ID	A grouping of routes based on a defined criteria or other information.
20, 21	Data[6, 7] Route Criteria Type. See Route Criteria Type entries below.	Identifies the type of information defining the route.
22	Data[8] Criteria Data: Format	0x01 Data in raw hex bytes 0x03 BCD (All digit based routes are BCD.)
23, 24	Data[9, 10] Criteria Data: Length of Criteria Data	
25	Data[11..N] Criteria Data	See Route Criteria Type entries below for the definition of remaining data.
:	Data[N+0, N+1] Entry Data TLV Count	2 Bytes
:	Data[N+2, N+3] Entry Data TLV Length	2 Bytes
:	Data[N+4] Entry Data: TLVs	See Route Entry Data TLV entries below.
:	Checksum

- 0x0010 Incoming Resource Group, Single/Range
- 0x0015 Terminating Resource Group, Single/Range
- 0x0065 Physical VoIP Channel
- 0x0071 Virtual VoIP Channel
- 0x03E9 User-defined

NOTE: See Notes 1, 2 and 3 below to configure the following Route Criteria Type entries.

- 0x2710 Universal Protocol Data, Single/Range
- 0x2717 Called Party Number, Single/Range
- 0x2718 Calling Party Number, Single/Range
- 0x2792 Source IP Address, Single/Range
- 0x2794 Destination IP Address, Single/Range
- 0x27B0 RTP Payload Type, Single/Range
- 0x27B4 IP Address Criteria, Single/Range
- 0x2919 NPDI SIP to Username, Single/Range
- 0x291A NPDI SIP to Hostname, Single/Range
- 0x2919 NPDI SIP from Username, Single/Range
- 0x291A NPDI SIP from Hostname, Single/Range
- 0x2A0E Media Connection Address, Single/Range

Notes

1. The second data format field that occurs after the length can have the following values:
 - 0x01 - Data in Raw Hex Bytes
 - 0x02 - ASCII Characters
 - 0x03 - BCD (all digit-based routes are BCD)
 - 0x04 - Decimal

2. The length of this field is variable. It is equal to the Criteria Length minus the length of the Criteria Header information (for example, all fields after the length and not including the digits and mask fields) divided by the number of digits and mask fields included.

Below is an example of how the Single bit in the Route Property Mask is set (see field 15 in Route Table (0x03) above).

To compute the Length of Field which is equal to 7, do the following:

Criteria Length (20) subtract (-) Length of Criteria Header (6) and divide (/) by number of Digit and Mask fields (2)

```

2a 0e    \ ' Media Connection Criteria Type
03       \ ' Criteria Data Format: BCD
00 14    \ ' Length
03       \ ' Criteria Data Format: BCD
63 \ ' Offset
00 00 00 00 \ ' Reserved - set to 0x00 0x00 0x00 0x00
04 05 05 06 06 07 08 \ ' Digits string
0f 0f 0f 0f 0f 0f 0f \ ' Mask
    
```

Below is an example of how the Range bit in the Route Property Mask is set (see field 15 in Route Table (0x03) above).

To compute the Length of Field which is equal to 1, do the following:

Criteria Length (9) subtract (-) Length of Criteria Header (6) and divide (/) by number of Digit and Mask fields (3)

- 2a 0e \ ' Media Connection Criteria Type
- 01 \ ' Criteria Data Format
- 00 09 \ ' Length
- 04 \ ' Criteria Data Format: Decimal
- 2c \ ' Offset
- 00 00 00 00 \ ' Reserved
- 0a \ ' From digits
- cd \ ' To digits
- ff \ ' Mask

3. The Offset field represents the number of channels to offset outgoing channel from incoming channel.

Resource Group Table (0x04) The format of the Resource Group Table is shown in the table below.

Byte	Field Description	Definition
Message Header		
8, 9	PPL Component ID (MSB, LSB)	See PPL Information chapter in <i>API Reference</i> .
10	Table Type	0x04 Resource Group Table
11	Table ID	Assigned by host
Table Data		
12, 13	Data[0, 1] Resource Group ID	
14, 15	Data[2, 3] Special Instructions	0x0001
16, 17	Data[4, 5]	Version Number should be 0x0001
18, 19	Data[6, 7] Number of AIBs	
20, 21	Data[8, 9] Length of AIBs	
22+	Data[:] AIB	See AIB Types
:	Data[:] Number of TLVs	The number of Tag/Length/Value entries to follow.

:	Data[:] Length of TLVs	
:	Data[:] TLVs	See TLV Types
:	Checksum	

Extended State/Event Table Format (0x07)

An Extended State/Event table is a group of valid events that pertain to a given state, the primitives that get invoked upon the occurrence the event, and the next state to transition into in response to the event(s). State/event tables allow for up to 100 states and up to 20 events per state. The Primitive Table is assigned to the protocol when the protocol is created with the *PPL Create* message.

The Extended State/Event Table format is shown in the table below.

Byte	Field Description	Definition
Message Header		
8, 9	PPL Component ID (MSB, LSB)	See list of Component IDs in this document.
10	Table Type	0x07 Extended State/Event Table
11	Table ID	Assigned by host
Table Data		
12	Data[0,1] Initial State Number	Identifies the current state that the protocol is in. States must be specified in order from 1 to 199. State numbers can be skipped. The initial State Type is assumed to be Normal.
13	Data[2] Number of Events	The number of valid events accepted by the state. Each state can accept up to 120 events. For best performance, events most likely to occur should be placed at the beginning of the list.
14, 15	Data[3,4] Event 1 # (MSB, LSB)	Bytes 14 and 15 are external processing events, such as, Alerting or Answer; or internal decision events. Bytes 16-19 are arguments that relate to events such as, filter timer IDs for line signaling events. See the <i>API Developer's Guide: PPL</i> for more details.
16, 17	Data[5, 6] Event Data 1 Value (MSB, LSB)	
18, 19	Data[7, 8] Event Data 2 Value (MSB, LSB)	
20, 21	Data[9, 10] Primitive ID (MSB, LSB)	The primitive invoked when the specified event occurs based on the Primitive Table associated with the event.
22	Data[11, 12] Next State Number	The state that the protocol should enter in response to the indicated event(s).
23	Data[13] Next State Type	0x01 Normal/Wait 0x02 Internal
Repeat Data[2-13] for each event associated with the state.

PPL Protocol Query 0x00DF

SwitchKit Name	PPLProtocolQuery
Type	EXS API and SwitchKit API message
Description	<p>PPL Protocol Query 0x00DF</p> <p>This message initiates a report from the CSP on the custom protocols (non-default) that have been downloaded to a PPL component. There are two methods.</p> <p>The first indicates every table downloaded to a particular PPL component and its associated protocols, if any. This is Sent by setting the Entity field to 0x00 (All Tables).</p> <p>The second indicates the name of a particular entity (table or protocol). This is initiated by setting the Entity field to either 0x01 (Primitive Table), 0x02 (State/Event Table), or 0x03 (Protocol), and specifying the ID in the Entity ID field.</p>
Sent by	Host
SwitchKit Code	<p>C Structure</p> <pre>typedef struct { unsigned short ComponentID; UBYTE Entity; UBYTE EntityID; } XL_PPLProtocolQuery;</pre> <p>C Structure Response</p> <pre>typedef struct { unsigned short Status; unsigned short ComponentID; UBYTE Entity; UBYTE EntityID; UBYTE Data[247]; } XL_PPLProtocolQueryAck;</pre> <p>C++ Class</p> <pre>class XLC_PPLProtocolQuery : public XLC_OutboundMessage { public: unsigned short GetComponentID() const; void setComponentID(unsigned short x); UBYTE getEntity() const; void setEntity(UBYTE x); UBYTE getEntityID() const; void setEntityID(UBYTE x); };</pre>

C++ Class Response

```
class XLC_PPLProtocolQueryAck : public
    XLC_AcknowledgeMessage {
public:
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    unsigned short getComponentID() const;
    void setComponentID(unsigned short x);
    UBYTE getEntity() const;
    void setEntity(UBYTE x);
    UBYTE getEntityID() const;
    void setEntityID(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

11	Entity ID The ID of the table or protocol to be queried. If the Entity is All Tables (0x00) set this field to 0x00.	12	Entity
12	Checksum	13	Entity ID

	Response continued below.
14	<p>Data[0] The data varies by the <i>Entity</i> being queried.</p> <p>0x00 All Tables Data[0] Number of Tables Data[1] Table Type 0x01 Primitive Table 0x02 State/Event Table 0x07 Extended State/Event Table Data[2]* Table ID (1-10) Data[3]* Associated Protocol (0xFF if none)</p> <p>Data[1-3] is repeated for each table</p> <p>All Others: Data[0] Entity Name A NULL-terminated ASCII string of up to 20 characters describing the protocol ("ITU-T Protocol"). Remaining byte offsets up to 20 are padded with 0x00.</p>
:	Checksum

Examples Assumptions

- Component: 0x12
- Downloaded Protocols
 02 cpc_CPG_T7
- Primitive Tables
 02 isup_cpc_itu_ppl_pr
- State Event Tables
 02 isup_cpc_itu_ppl_st

Query All Tables

Message

To query all tables, you would send the message as shown below, with the following values:

- Component ID: **00 12**
- Entity: All Tables (**00**)
- Entity ID: **00**

H->X

[00 09 00 df 00 00 ff 00 12 00 00]

Response

The CSP returns the following bytes indicating that component 12 has 2 tables:

- Primitive Table 02 (Protocol 2)
- State Event Table 02 (Protocol 2)

X->H

[00 12 00 df 00 00 01 00 10 00 12 00 00 **02 01 02 02 02 02**
02]

Query Primitive Table

Message

To retrieve the name of Primitive Table 2, you would send the following bytes:

- Entity **01** (Primitive Table)
- Entity ID **02**

H->X

[00 09 00 df 00 00 ff 00 12 **01 02**]

Response

The CSP responds with a string of ASCII characters indicating the protocol name: isup_cpc_itu_ppl_pr

X->H

[00 1f 00 df 00 00 01 00 10 00 12 01 02 **69 73 75 70 5f 63**
70 63 5f 69 74 75 5f 70 70 6c 5f 70 72 00]

Query Entities 0x02 (State/Event Table), 0x03 (Protocol), and 0x07 (Extended State/Event Table) would return similar results.

PPL Table Download Initiate 0x00D5

SwitchKit Name PPLInitiateDownload

Type EXS API and SwitchKit API message

Description **PPL Table Download Initiate 0x00D5**

This message allows the host to initiate the download of a primitive table or a state/event table for use in a protocol.

This message results in the CSP allocating space for the specified table, which is then downloaded using the *PPL Table Download* message. The host assigns a Table ID to identify the table in subsequent messages. The host must manage the use of all PPL Table IDs.

Sent by Host

SwitchKit Code **C Structure**

```
typedef struct {
    unsigned short ComponentID;
    UBYTE TableType;
    UBYTE TableID;
    int TableSize;
    char TableName[20];

PPLTool

Type	SwitchKit API message
Purpose	Use the PPLTool message to send either a hex format configuration (*.cfg) or a *.rep file (generated from Dialogic's technical support) to a specified node.
Description	This message downloads <u>either</u> a *.rep file or a *.cfg file (but not both) to the switch.
Sent by	SwitchManager
Arguments	The following table shows the user modifiable arguments of this message:

Argument	Description
Node	The node ID the file is destined for.
cfgFile	The *.cfg filename of the file to parse and send. The maximum size of the cfgFile name is 160 bytes.
repFile	The *.rep filename of the file to parse and send.

Configuration To download a PPL rep file:
pplTool(
 Node = integer,
 repFile = quoted string);

To download a configuration file:
pplTool(
 Node = integer,
 cfgFile = quoted string);

C Structure typedef struct {
 char RepFile[100];
 char CfgFile[100];
 } *SK_PPLTool*;

C++ Class class *SKC_PPLTool* : public SKC_DummyMessage {
 public:
 const char *getRepFile() const;
 void setRepFile(const char *x);
 const char *getCfgFile() const;
 void setCfgFile(const char *x);
 };

PPL Timer Configure 0x00CF

SwitchKit Name PPLTimerConfig

Type EXS API and SwitchKit API message

Description **PPL Timer Configure 0x00CF**

This message allows the host to configure PPL timers.

The 100 generic timers are used as defined by the protocol tables. The protocol designer must specify which timers are used, and how. This message allows the timers to be adjusted without having to modify the PPL State/Event or Primitive Tables.

NOTE: This message does not support the older ST1LC line cards. The correct message to use for these older line cards is the *Filter/Timer Configure* message (0x12).

Sent by Host

Product License Download 0x0079

SwitchKit Name ProductLicenseDownload

Type EXS API and SwitchKit API message

Description **Product License Download 0x0079**

This message is used to download one software key. Regardless of how a software or hardware module has been locked, you unlock all functionality with this message.

This message provides the mechanism for a host application to send the software feature or hardware upgrade license codes to the CSP. In a multi-node system, any node will accept and recognize these software feature licenses.

NOTES: For *SwitchKit*, when resetting a card such as, a T_ONE, E-ONE or J-ONE, a *ProductLicenseDownload* message is sent by SwitchManager so that the licensed hardware is available after a card reset. If the licensed card is permanently removed and the corresponding *ProductLicenseDownload* is not removed from the configuration, then any subsequent resets of matching card types will cause the *ProductLicenseDownload* to be NACKed.

Sent by Host

Recorded Announcement File System Report 0x0119

SwitchKit Name RecAnnFSReport

Type EXS API and SwitchKit API message

Description **Recorded Announcement File System Report 0x0119**

This message reports information about the file system used by the VRAS SIMM's Flash memory on the DSP-ONE card. It also reports used, available, and deleted memory. To receive this message, the host must send a *Recorded Announcement File System Query*.

Sent by CSP

SwitchKit Code **C Structure**

32	Checksum		

Memory Field Information

The memory is reported in 32-bit words because that is the smallest memory storage unit. This means that a RAN six bytes long uses 2 words of memory for storing the RAN data.

Both File System revisions 0 and 1 use 16 words of memory for header information for each RAN stored.

File System revision 0 removes 16 words for each of the 2048 RANs (32768 words total) that could be stored on the VRAS SIMM from the available memory. So the total Available Memory for File System revision 0 is 0x5F8000. The Used Memory field counts only the memory words used for the RAN data, not the 16 words used for the RAN header.

File System revision 1 does not know the maximum number of RANs that may be stored on the VRAS SIMM, so the 16 words of header information for each RAN stored is added to the Used Memory for each RAN. Thus the total Available Memory for File System revision 1 is 0x600000. The deleted memory in the Defragmentation Level field also includes the 16 words for each deleted RAN.

Recorded Announcement File System Convert 0x0118

SwitchKit Name RecAnnFSConvert

Type EXS API and SwitchKit API message

Description **Recorded Announcement File System Convert 0x0118**

This message converts the file system used by the VRAS SIMM's Flash memory on the DSP-ONE card to the file system specified in the File System field. The VRAS SIMM must first be taken out of service with the *Service State Configure* message.

The host must wait for an *Alarm* message of “*Recorded Announcement File System Convert Success*” before bringing the VRAS SIMM in service. It may take up to five minutes for the alarm to be sent. If the conversion fails, the host receives an *Alarm* message of “*Recorded Announcement File System Convert Failure*” and the host should take action appropriate to the failure reason. The failure reason is in the Failure Code field of the *Alarm* message.

Recorded Announcement Single Delete 0x0117

SwitchKit Name RecAnnSingleDelete

Type EXS API and SwitchKit API message

Description **Recorded Announcement Single Delete 0x0117**

This message deletes a single Recorded Announcement (RAN), provided that the VRAS SIMM's Flash File System has been upgraded to revision 1 (0x0001). For example, deleting RAN ID 0x0001 on VRAS SIMM 0x02, Slot 0x00 deletes any instance of RAN ID 0x0001 stored on the DSP-ONE card in Slot 0x00, SIMM 0x02. But all other instances of RAN ID 0x0001 stored on a different DSP-ONE card, or on a different VRAS SIMM on the same card, remain unchanged.

This message can also be used just as the older message *Recorded Announcement Delete* (0x54) was used--to delete the VRA SIMM's entire Flash memory.

The host should wait for an *Alarm* message of "Single RAN Deleted on SIMM" or "VRAS Erase Complete" before performing another deletion or download of a RAN. This message may be sent to an In Service or Out of Service VRAS SIMM.

This message provides the following wildcards:

- Set the RAN ID field to 0xFFFF to delete all RANs on a Slot and VRAS SIMM (erase the VRAS SIMM's entire Flash memory). You **must** set the RAN ID to 0xFFFF if you are using the MFDSP card or you are using the DSP-ONE card with the older Flash File System, revision 0 (0x0000). When the RAN ID is 0xFFFF, a forced deletion is always performed (even currently-playing RANs are deleted).
- Set the VRAS SIMM field of the AIB to 0xFF to delete all instances of a RAN on all VRAS SIMMs.
- Set the Slot field of the AIB to 0xFF to delete all instances of a RAN on all slots.

You can combine the wildcards. For example, combining RAN ID 0xFFFF, VRAS SIMM 0xFF, and Slot 0xFF deletes **all** RANs stored on **all** VRAS SIMMs on **all** of the DSP cards (slots) in the chassis.

The Forced Flag field indicates whether the host deletes the RAN forcefully or gracefully. A forced RAN deletion cancels even currently-playing instances of that RAN. The forced deletion also cancels the playing of a RAN chain that needs the RAN ID on the DSP-ONE card. When the RAN ID is the wildcard (0xFFFF) a forced deletion is always performed.

A graceful RAN deletion is NACKed (and the RAN is not deleted) if the RAN is currently playing in Barge In mode, or if the RAN is needed for a current RAN chain or for a queued play request. If the RAN is currently playing, it is deleted only after it has finished playing. The graceful deletion is for single RAN IDs only.

Sent by Host

Recorded Announcement File System Defragment 0x0103

SwitchKit Name RecAnnFSDefrag

Type EXS API and SwitchKit API message

Description **Recorded Announcement File System Defragment 0x0103**

This message recovers unused memory in the file system used by the VRAS SIMM's Flash memory on the DSP-ONE card. It is used after single Recorded Announcements (RANs) have been marked for deletion using the *Recorded Announcement Single Delete* (0x0117) message. The VRAS SIMM must first be taken out of service with the *Service State Configure* message. The host should wait for an *Alarm* message of "Recorded Announcement Defragment Complete" before bringing the VRAS SIMM in service. If defragmentation fails, the host receives an *Alarm* message of "Recorded Announcement File Defragmentation Failure" and the host should take action appropriate to the failure reason. The failure reason is in the Failure Code field of the *Alarm* message.

Recorded Announcement Report 0x0058

SwitchKit Name RecAnnReport

Type EXS API and SwitchKit API message

Description **Recorded Announcement Report 0x0058**

This message is generated in response to a *Recorded Announcement Query* message sent by the host. It can contain information on up to 10 announcements.

Sent by CSP

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE Slot;
    UBYTE SIMM;
    UBYTE AnnounceCount;
    UBYTE Data[222];
} XL_RecAnnReport;
```

C++ Class

```
class XLC_RecAnnReport : public XLC_InboundMessage {
public:
    UBYTE getSlot() const;
    void setSlot(UBYTE x);
    UBYTE getSIMM() const;
    void setSIMM(UBYTE x);

NOTE: The *Announcement* fields are repeated for each announcement. The number of announcements is defined in the *Announcement Count* field.

Recorded Announcement Query 0x0057

SwitchKit Name RecAnnQuery

Type EXS API and SwitchKit API message

Description **Recorded Announcement Query 0x0057**

This message allows the host to query information about the announcements stored on a VRAS SIMM. The information is reported to the host via the *Recorded Announcement Report* message:

- If announcements are stored on the SIMM, the response to this message indicates the number of announcements stored on the specified SIMM.
- If no announcements are stored on the VRAS SIMM, the CSP does *not* send a report.

In the *Recorded Announcement Report* message, the host will receive the ID, size, checksum, format, and encoding format for each announcement stored on the specified SIMM.

Sent by Host

Recorded Announcement Connect 0x0055

SwitchKit Name RecAnnConnect

Type EXS API and SwitchKit API message

Description **Recorded Announcement Connect 0x0055**

Use this message to connect a channel to one or a series of downloaded voice recorded announcements (RANs).

NOTE: You can use this message for the DSP Series 2 card, but only for RAN IDs below 4096. In CSPs using the DSP Series 2 card with the DSP-ONE card, the CSP Matrix Series 3 Card examines the announcement ID(s) and determines if there are any DSP-ONE cards that can play the entire list of announcements. If there is no DSP-ONE card that can do this, the request is passed to the DSP Series 2 card. Because of this, the DSP Series 2 card must either have all the same announcements loaded onto it as all the DSP-ONEs via TFTP, or all the announcements must be accessible via NFS.

Recorded Announcement Delete 0x0054

SwitchKit Name RecAnnDelete

Type EXS API and SwitchKit API message

Description **Recorded Announcement Delete 0x0054**

This message deletes *all* announcements stored on a VRAS SIMM. Deletion of a SIMM takes approximately 30 seconds. The host should wait for an *Alarm* message of “VRAS Erase Complete” before downloading a new announcement to a SIMM.

Sent by Host

SwitchKit Code **Configuration**

```
RecAnnDelete (
    Node = integer,
    Slot = integer,
    SIMM = integer,
    Reserved = integer,
    ForcedFlag = integer);
```

C Structure

```
typedef struct {
    UBYTE Slot;

Recorded Announcement Download 0x0053

SwitchKit Name RecAnnDownload

Type EXS API and SwitchKit API message

Description **Recorded Announcement Download 0x0053**

This message is used to download an announcement to VRAS SIMM and is no longer than 230 bytes. The RAN download is made up of one *RAN Download Initiate* message (0x0052) followed by many *RAN Download* messages (0x0053).

Sent by Host

Example Message (Socket Log Output for SwitchKit)

Recorded Announcement Download Initiate 0x0052

SwitchKit Name RecAnnDownloadInit

Type EXS API and SwitchKit API message

Description **Recorded Announcement Download Initiate 0x0052**

This is the first message sent by the host to initiate the downloading of a recorded announcement to a VRAS SIMM. If multiple SIMMs are to have the same announcement, each SIMM must be downloaded separately. If you try to use this message for the DSP Series 2 card, the CSP Matrix Series 3 Card NACKs it.

For SwitchKit

This message downloads a voice file to a VRAS board on the CSP. The format and encoding correspond to the arguments of the RecAnnDownloadInitiate message. The slot and SIMM must refer to a valid VRAS SIMM, and the ID is used to reference this prompt from future messages. If the voice file is already present on the SIMM, the SwitchManager bypasses the downloading. If there is another voice file with that ID already on the SIMM, then the configuration fails. The VRAS SIMM must be cleared with a RecAnnDelete before the new voice file is downloaded.

Sent by Host (SwitchManager for SwitchKit)

Example Message (Socket Log Output for SwitchKit)

See *Recorded Announcement Download 0x0053* for the socket log output/example of the *Recorded Announcement Download Initiate* message and a *Recorded Announcement Download* message together.

SwitchKit Code **Configuration**

```
RecordedAnnouncement(  
    file = quoted string,  
    slot = integer,  
    SIMM = integer,  
    id = integer,  
    format = integer,  
    encoding = integer  
);
```

C Structure

```
typedef struct {  
    UBYTE Slot;  
    UBYTE SIMM;  
    unsigned short ID;  
    int Size;  
    int Checksum;  
    UBYTE Format;  
    UBYTE Encoding;  
} XL_RecAnnDownloadInit;
```

Receive Signaling Configure 0x0015

SwitchKit Name ReceiveSignalingConfig

Type EXS API and SwitchKit API message

Description **Receive Signaling Configure 0x0015**

This message is used to define the signaling received by the CSP for non-standard trunk or line interfaces on the STILC card.

This message **cannot** be used with the T-ONE card. Line signaling for the T-ONE card is configured with T1 PPL Config Bytes 111–116 using the *PPL Configure* message.

NOTE: This message should not be used without first contacting Dialogic Technical Support.

Sent by Host

SwitchKit Code **Configuration**

```
ReceiveSignalingConfig (
    Node = integer,
    Range = StartSpan:StartChan - EndSpan:EndChan,
    SignallingType = integer,
    SignallingValue = integer,
    TransmissionMode = integer,
    BitMask = integer);
```

C Structure

```
typedef struct {
    unsigned short StartSpan;
    UBYTE StartChannel;
    unsigned short EndSpan;
    UBYTE EndChannel;

	0x03 Secondary Inseize		
	0x04 Outseize Acknowledgment		
	0x05 Answer		
	0x06 Post Inseize Acknowledgment		
:	Signaling Value		
	Bit 0 A		
	Bit 1 B		
	Bits 2–7 Reserved, must be 0x00		
:	Transmission Mode		
	0x01 A and B Fixed		
	0x02 A Fixed, B Pulsed		
	0x03 A Pulsed, B Fixed		
	0x04 A Pulsed, B Pulsed		
	Pulsed mode timing is determined by ringing on/off timers.		
:	Bit Mask		
	This byte assigns a “Don’t Care” status to bits in the Signaling Value field (for example, 0x01 = consider A bit only, 0x03 = consider A and B bits only).		
:	Checksum		

Example—Inverting E&M Signaling

This example shows the message sequence sent to invert the default E&M Wink Start receive signaling on a channel. The default E&M signaling values are: On-hook: A = 0, B = 0; all other signaling: A = 1, B = 1.

A separate message must be sent to change each signaling type. The examples below show the values which would be sent in each message.

Signaling Type	0x01 (On-hook)
Signaling Value	0x03 (A = 1, B = 1)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Signaling Type	0x02 (Initial Inseize)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Signaling Type	0x03 (Secondary Inseize)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Signaling Type	0x04 (Outseize Acknowledgment)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Signaling Type	0x05 (Answer)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Signaling Type	0x06 (Post Outseize Acknowledgment)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)
Bit Mask	0x03 (A and B)

Record File Modify 0x011F

SwitchKit Name RecordFileModify

Type EXS API and SwitchKit API message

Description **Record File Modify 0x011F**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to modify a current record file session. You can pause, resume, or modify the gain of the recording.

Sent by Host application

Record File Start 0x011E

SwitchKit Name RecordFileStart

Type EXS API and SwitchKit API message

Description **Record File Start 0x011E**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to start a file recording.

You can select the channel and the DSP card, or let the CSP Matrix Series 3 Card choose the DSP Card by leaving the DSP slot set to 0xFF. The CSP Matrix Series 3 Card reports back in the response which DSP Card has been selected.

The Initial Silence Timer specifies how much silence is allowed before the card aborts the recording. The Final Silence Timer specifies how much silence is allowed before the silence triggers the card to stop recording voice.

Any delay between the beginning of conversation and the beginning of recording can result into clipped recorded media. To alleviate this potential problem, Dialogic recommends sending the *Record File Start* message before the conversation begins (before the *Resource Connect* message). Recording sessions involve a signal energy detection threshold, so the silence before conversation will not be recorded.

RedundantAppPoolsQuery

Type	SwitchKit API message
Description	<p>Use the <i>SK_RedundantAppPoolsQuery</i> message to determine which Redundant Application Pools (RAPs) are defined within the Low-Level Communicator. For example, using this message you can determine which application is the primary one. You cannot modify arguments in this query.</p> <p>The LLC responds to the original query with the message <i>SK_RedundantAppPoolsQueryAck</i>. The response contains a list of all currently defined RAPs within the LLC. The information given in the list can be used to query individual RAPs with <i>SK_RedundantAppQuery</i> or <i>SK_RedundantAppPoolMembersQuery</i>.</p>
Syntax	<p>The data field of this message contains a sequence of null-terminated strings, where each string is the name of a RAP. See the following example:</p> <pre>Data[RAPa\ORAPb\ORAPc\0]</pre> <p>This indicates that there are three RAPs, named “RAPa”, “RAPb”, and “RAPc”.</p>
Sent by	Monitoring application or Converged Services Administrator (CSA)

};
```

Redundant App Pool Members Query

Type SwitchKit API message

Description Use this message to determine which applications are members of a specific Redundant Application Pool (RAP).

The LLC responds to the original query with the message *SK_RedundantAppPoolMembersQueryAck*. The response includes a list of application IDs that are currently members of a RAP. The response also indicates which application is the primary application in the pool.

Sent by Monitoring application or Converged Services Administrator (CSA).

Arguments The following table shows the arguments you can modify:

Argument	Description
RedundantAppPoolID	The RedundantAppPoolID is a string that uniquely identifies the class of application wishing to be treated as redundant applications.

Notes: RAP IDs are case sensitive!

C Structure

```
typedef struct {
    char RedundantAppPoolID[32];
} SK_RedundantAppPoolMembersQuery;
```

C Structure Response

```
typedef struct {
    int Status;
    char RedundantAppPoolID[32];
    int PrimaryAppName;
    int NumAppNames;
    int AppNames[10];
} SK_RedundantAppPoolMembersQueryAck;
```

C++ Class

```
class SKC_RedundantAppPoolMembersQuery : public
    SKC_ToolkitMessage {
public:
    const char *getRedundantAppPoolID() const;
    void setRedundantAppPoolID(const char *x);
};
```

C++ Class Response

```
class SKC_RedundantAppPoolMembersQueryAck : public
    SKC_ToolkitAck {
public:
    int getStatus() const;
```

Redundant App Pool Members Query

```
void setStatus(int x);
const char *getRedundantAppPoolID() const;
void setRedundantAppPoolID(const char *x);
int getPrimaryAppName() const;
void setPrimaryAppName(int x);

void setNumAppNames(int x);
const int *getAppNames() const;
void setAppNames(const int *x);
};
```

RedundantAppQuery

Type	SwitchKit API message
Description	Use the <i>SK_RedundantAppQuery</i> message to determine the specifications of a member application within a specific Redundant Application Pool (RAP). Since an application can be a member of several RAPs, <i>SK_RedundantAppQuery</i> needs to be sent for each RAP of which an application is a member.
Sent by	Monitoring application or Converged Services Administrator (CSA)
Arguments	The following table shows the user modifiable arguments:

Argument	Description
AppName	AppName is the application name of the requesting application. The name can be obtained by calling <code>sk_getConnectionName()</code> .
RedundantAppPoolID	The RedundantAppPoolID is a string that uniquely identifies the class of application wishing to be treated as redundant applications.

Notes: RAP IDs are case sensitive!

C Structure

```
typedef struct {
    char RedundantAppPoolID[32];
    int AppName;
} SK_RedundantAppQuery;
```

C Structure Response

```
typedef struct {
    int Status;
    char RedundantAppPoolID[32];
    int AppName;
    int RedundantAppPriority;
    int IsPrimary;
    unsigned short DataSize;
    UBYTE Data[203];
} SK_RedundantAppQueryAck;
```

C++ Class

```
class SKC_RedundantAppQuery : public SKC_ToolkitMessage {
public:
    const char *getRedundantAppPoolID() const;
    void setRedundantAppPoolID(const char *x);
    int getAppName() const;
```

```
void setAppName(int x);  
};
```

C++ Class Response

```
class SKC_RedundantAppQueryAck : public SKC_ToolkitAck {  
public:  
    int getStatus() const;  
    void setStatus(int x);  
    const char *getRedundantAppPoolID() const;  
    void setRedundantAppPoolID(const char *x);  
    int getAppName() const;  
    void setAppName(int x);  
    int getRedundantAppPriority() const;  
    void setRedundantAppPriority(int x);  
    int getIsPrimary() const;  
    void setIsPrimary(int x);  
    unsigned short getDataSize() const;  
    void setDataSize(unsigned short x);  
    const UBYTE *getData() const;  
    UBYTE *getData();  
    void setData(UBYTE *x);  
};
```

RedundantAppStatusMsg

Type SwitchKit API message

Description The LLC sends *SK_RedundantAppStatusMsg* to notify members of a Redundant Application Pool (RAP) about any changes to the state of the RAP.

This message is sent when an application first registers for membership and when the status of a member application changes. Status changes include the following:

- An application registers for membership
- An application sends the *SK_ReselectPrimaryApp* message
- An application deregisters from membership in the RAP
- An application changes to primary

Sent by LLC

Arguments You can modify the following arguments:

Argument	Description
AppName	AppName is the application name of the requesting application. The name can be obtained by calling <i>sk_getConnectionName()</i> .
RedundantAppPoolID	The RedundantAppPoolID is a string that uniquely identifies the class of application wishing to be treated as redundant applications. Notes: RAP IDs are case sensitive.

Argument	Description
RedundancyStatus	<p>Values defined for this argument are:</p> <ul style="list-style-type: none"> • SK_RED_STATUS_REMOVED (0) - The specified application has been removed from the redundant application. • SK_RED_STATUS_PRIMARY (1) - The specified application is the primary app for the redundant app group. • SK_RED_STATUS_SECONDARY (2) - The specified application is a secondary application for the redundant application group. • SK_RED_STATUS_NO_PRIMARY (3) -There is no primary application for the redundant app group. • SK_RED_STATUS_MONITOR (4) - The specified application is a monitoring application of the redundant application group.

C Structure

```
typedef struct {
    int AppName;
    char RedundantAppPoolID[32];
    UBYTE RedundancyStatus;
} SK_RedundantAppStatusMsg;
```

C++ Class

```
class SKC_RedundantAppStatusMsg : public
    SKC_ToolkitInbound {
public:
    int getAppName() const;
    void setAppName(int x);
    const char *getRedundantAppPoolID() const;
    void setRedundantAppPoolID(const char *x);
    UBYTE getRedundancyStatus() const;
    void setRedundancyStatus(UBYTE x);
};
```

Redundant LLC Register

Type	SwitchKit API message
Description	<p>This message is used internally between the primary LLC and the redundant LLC.</p> <p>This message does not have a response.</p>
Sent by	LLC
C Structure	<pre>typedef struct { } <i>SK_RedundantLLCRegister</i>;</pre>
C++ Class	<pre>class <i>SKC_RedundantLLCRegister</i> : public SKC_AdminMessage { public: };</pre>

RegisterAsRedundantApp

Type SwitchKit API message

Description The *SK_RegisterAsRedundantApp* message is used by the function `sk_registerAsRedundant()`.

If an application needs to register for membership into a Redundant Application Pool (RAP), the application must call the function `sk_registerAsRedundant()`. The function then uses the *SK_RegisterAsRedundantApp* message to register the application for membership into a RAP.

To remove an application from a pool, the application calls the function `sk_deregisterAsRedundant()`, which then also uses the message to take a member out of the pool.

A *SK_RegisterAsRedundantAppAck* message is an acknowledgment by the LLC, indicating the completion of the original request.

Sent by Function `sk_registerAsRedundant()`

Arguments You can modify the following arguments:

Argument	Description
AppName	AppName is the application name of the requesting application. The name can be obtained by calling <code>sk_getConnectionName()</code> .
RedundantAppPoolID	The RedundantAppPoolID is a string that uniquely identifies the class of application wishing to be treated as redundant applications. Notes: RAP IDs are case sensitive.

Argument	Description
RedundantAppPriority	<p>RedundantAppPriority is a value indicating the current priority of the application. The higher the value, the more likely it is that the LLC will select the application as primary. Predefined values are:</p> <p>SK_RED_APP_PRI_MONITOR (0) Used by an application wishing to monitor the activity of this RedundantAppClass. An application selecting this priority cannot be considered either primary or secondary.</p> <p>SK_RED_APP_PRI_REMOVED (-1) Used when an application needs to be removed from an RedundantAppClass for which it has previously registered.</p>
DataSize	Size of the data
Data	Data bytes

C Structure

```
typedef struct {
    int AppName;
    char RedundantAppPoolID[32];
    int RedundantAppPriority;
    unsigned short InitiateSwitchover;
    unsigned short DataSize;
    UBYTE Data[211];
} SK_RegisterAsRedundantApp;
```

C Structure Response

ReleaseCacheChannels

Type	SwitchKit API message
Description	This message is used by the function sk_returnChannel() to make channel available.
Sent by	Function sk_returnChannel()
C Structure	<pre>typedef struct { } SK_ReleaseCacheChannels;</pre>
C++ Class	<pre>class SKC_ReleaseCacheChannels : public SKC_AdminMessage { public: };</pre>

Remove Channels From Group

Type	SwitchKit API message
Description	Use this message to remove channels from an existing channel group.
Sent by	SwitchManager or Application
Configuration	<i>RemoveChannelsFromGroup</i> (ChannelGroup = quoted string, range = startSpan:startChannel - endSpan:endChannel);
C Structure	<pre>typedef struct { BaseFields Base; unsigned short StartSpan; unsigned short EndSpan; UBYTE StartChannel; UBYTE EndChannel; char ChannelGroup[45]; UBYTE reserved68[16]; } <i>SK_RemoveChannelsFromGroup</i>;</pre>
C++ Class	<pre>class <i>SKC_RemoveChannelsFromGroup</i>: public SKC_AdminMessage { public: SKC_RemoveChannelsFromGroup(int sz = 0); ~SKC_RemoveChannelsFromGroup(); SK_DECLARE_CLASS(SKC_RemoveChannelsFromGroup, SKC_Admin Message) virtual MsgStruct *getStructPtr(); virtual const MsgStruct *getStructPtr() const; virtual int getTag() const; unsigned short getStartSpan() const; void setStartSpan(unsigned short x); unsigned short getEndSpan() const; void setEndSpan(unsigned short x); UBYTE getStartChannel() const; void setStartChannel(UBYTE x); UBYTE getEndChannel() const; void setEndChannel(UBYTE x); const char *getChannelGroup() const; void setChannelGroup(const char *x); };</pre>

Remove Channels From Group

Example The following is an example of *RemoveChannelsFromGroup* for Channel Group “all”, with a range of span 0/channel 2 - span 1/channel 3.

```
RemoveChannelsFromGroup(  
  ChannelGroup="all",  
  Range=0:2-1:3);
```

RemoveLLCRoutingID

Type SwitchKit API message

Overview This message will remove an individual RoutingID from the LLC but leave the connection to the card and all other RoutingID's established even after the last RoutingID is removed. However, if an attempt is made to remove the last RoutingID before removing the connection, the LLC will log a message stating that the devices have been orphaned and will then remove the RoutingID. At this point the LLC maintains communications with the card pair but the socket pair is reported as being down so that applications will not attempt to send/receive messages to it. After a pair of devices have been orphaned (all RoutingID's have been removed), routing and communications for an application can be re-established without establishing a new connection by configuring a new RoutingID for that card IP pair using the *AddLLCCard* message.

Sent by Application

C Structure

```
typedef struct {
    BaseFields Base;
    int RoutingID;
    unsigned short CardType;
    UBYTE reserved23[4];
} SK_RemoveLLCRoutingID;
```

C Structure Response

```
typedef struct {
    BaseFields Base;
    int Status;
    int RoutingID;
    UBYTE Reserved1;
    UBYTE reserved26[5];
} SK_RemoveLLCRoutingIDAck;
```

C++ Class

```
class SKC_RemoveLLCRoutingID : public
    SKC_ToolkitMessage {
public:
    SKC_RemoveLLCRoutingID(int sz = 0);
    ~SKC_RemoveLLCRoutingID();

    SK_DECLARE_CLASS(SKC_RemoveLLCRoutingID, SKC_ToolkitMes
    sage)

    virtual MsgStruct *getStructPtr();
```

RemoveLLCRoutingID

virtual const MsgStruct *getStructPtr() const;
virtual int getTag() const;

int getRoutingID() const;
void setRoutingID(int x);
unsigned short getCardType() const;
void setCardType(unsigned short x);
```

C++ Class Response

```
class SKC_RemoveLLCRoutingIDAck : public
    SKC_ToolkitAck {
public:
    SKC_RemoveLLCRoutingIDAck(int sz = 0);
    ~SKC_RemoveLLCRoutingIDAck();

    SK_DECLARE_CLASS(SKC_RemoveLLCRoutingIDAck,SKC_Toolkit
    Ack)

    virtual MsgStruct *getStructPtr();
    virtual const MsgStruct *getStructPtr() const;
    virtual int getTag() const;

    int getStatus() const;
    void setStatus(int x);
    int getRoutingID() const;
    void setRoutingID(int x);
    UBYTE getReserved1() const;
    void setReserved1(UBYTE x);
```

RemoveLLCRoutingIDAck

The LLC will acknowledge the RemoveLLCRoutingIDAck with a RemoveLLCRoutingAck message.

```
RemoveLLCRoutingIDAck (Status=<**Response Value>
RoutingID=      <Unique ID for Card Pair>,
Reserved1=      <Not currently used>);
```

Status Field

Possible Response Values found in the Status field of an RemoveLLCRoutingIDAck Message.

**Response Values	Action
SK_SUCCESS	The RoutingID was successfully removed.
SK_NOT_PRESENT	The RoutingID was not found.
SK_NO_MESSAGE	Invalid message parameter found while processing request.

RoutingID Macros

To avoid duplicate values, the routing ID for each type of sub-component card must be derived using that cards corresponding get_RoutingID macro. Macros will be defined within SK_API.h so that they are globally accessible.

Macros available for deriving RoutingID's

CardType	Function
SK_SS7TCAP_BOARD (0x03)	getSS7TCAP_RoutingID(int stackid(0-255));

RequestChannelAck

Type SwitchKit API message

Description The LLC sends this message as a response to a previously sent **sk_requestOutseizedChannel()** or **sk_requestChannel()**. It notifies the application that a channel has been assigned to it, which must later be returned with **sk_returnChannel()**. It is important to note that even in the case of a **SK_OUTSEIZE_NACK**, a channel has been assigned to the application which must be returned.

To check the return status, you should first check **SKStatus**. Only if **SKStatus** contains **SK_OUTSEIZE_NACK** should **XLStatus** be examined. Otherwise, **XLStatus** will contain invalid data.

SKStatus will contain one of the following values:

- **OK** - the channel referenced by “Span/Channel” was successfully outseized. Span/Channel is considered allocated to this application, and must be returned through **sk_returnChannel** when the application is done with it.
- **SK_OUTSEIZE_NACK** - the channel Span/Channel received an **XLStatus** nack from the Outseize attempt. This will only be returned after the number of retries specified in the **sk_requestOutseizedChannel()** have all been tried and failed. The last Span, Channel whose outseize failed is considered allocated to this application, and must be returned through **sk_returnChannel()** when the application is done with it.
- **SK_NO_CHANNELS** - none of the channels in the requested group were available. The channels might be unavailable because they’re in use, out of service, or in yellow or red alarm. In this case, Span/Channel will contain invalid data, as no channel has been assigned to the application.

Request For Service With Data 0x002D

SwitchKit Name RFSWithData

Type EXS API and SwitchKit API message

Description **Request For Service With Data 0x002D**

This message is sent to the host when an incoming call is detected on the specified channel and the specified channel was previously configured to “report incoming call with digits.”

For SS7, the system uses this message as a response to an IAM message from the network. By default, BT IUP parameters are reported to the host in a BT IUP parameters ICB. The host can modify this to have address data sent as BCD-encoded digits.

SIP endpoints report incoming calls from the SIP side using the *Request for Service with Data* message. The data type Universal Data (0x33) is for SIP calls. The UPDF parameters supported are the same as those supported in the *Route Control* message.

H.323 endpoints report incoming calls from the H.323 side using the *Request for Service with Data* message. The data type Universal Data (0x33) is for H.323 calls. The UPDF parameters supported are the same as those supported in the *Route Control* message.

Sent by CSP

Resent This message is resent once after five seconds. It includes a field to indicate it has been resent.

Example Message (Socket Log Output)

In the example message below, phone 333@10.10.65.37 is calling phone 666. Phone 333 is registered with the CSP, which is at IP address 10.10.65.20.

Stage Status

The system reports the stage status for each of the five stages. Timers can be configured.

Valid entries for this field are as follows:

- 0x10 Positive Acknowledgment – Digits received
- 0x80 Partial Dial Condition – Receive Inter-digit Duration timer expired
- 0x81 Permanent Signal Condition – Receive 1st Digit Detection Timer expired
- 0x91 Inpulse Stage Not Collected – Stage not collected; no further stage information will be reported.
- 0x92 Digit Complete Timeout

NOTES:

- 1 Each stage may contain up to two strings.
- 2 Valid responses to this message may also be *Connect*, *Connect With Pad*, *Connect One-Way Forced*, *Connect With Data*, *Connect Wait*, *Connect To Conference*, *Connect One-Way To Conference*, and *Park Channel*.

RequestStandbyPoll

Type	SwitchKit API message
Description	Use this message to initiate the sending of a poll message from a node's standby CSP Matrix Series 3 Card. Important! Polls cannot be requested from SS7 cards.
Sent by	Application
C Structure	<pre>typedef struct { } SK_RequestStandbyPoll;</pre>
C++ Class	<pre>class SKC_RequestStandbyPoll : public SKC_AdminMessage { public: };</pre>

Reselect Primary App

Type SwitchKit API message

Description Use the *SK_ReselectPrimaryApp* message to indicate to the LLC that the primary application should be selected for a specific Redundant Application Pool (RAP). By default, the first application to connect to the LLC is the primary application. You can change which application is designated as primary, using the appropriate variable. After receiving this message, the LLC looks at all members of a RAP and selects a new primary application for the RAP. The Flag field dictates the behavior of this command as described in the arguments table further on this page.

If the LLC selects a new primary application, all members of the specific RAP are notified about the change in status, including the indication.

The *SK_ReselectPrimaryAppAck* is the response to the initial *SK_ReselectPrimaryApp* message, and it indicates the success or failure of the reselect.

Sent by Application

Arguments The following table shows the arguments that you can modify:

Argument	Description
RedundantAppPoolID	<p>The RedundantAppPoolID is a string that uniquely identifies the class of application wishing to be treated as redundant applications.</p> <p>Notes: RAP IDs are case sensitive!</p>
Flag	<p>The Flag indicates the reselect behavior.</p> <ul style="list-style-type: none"> • SK_RED_RESELECT_DEFAULT (0) - Execute primary selection algorithm using priority. The application with the highest priority is selected as primary. No change is made if the value of the current primary is equal to or higher than of all other applications. • SK_RED_RESELCT_PRIMARY (1) - The requesting application should be made primary. The Application must be a member of the RAP and cannot be a monitor of that RAP. • SK_RED_RESELCT_SECONDARY (2) - the requesting application should be made secondary. If the application is already secondary, this request has no impact on the RAP.

Status	The Status is the result of the original request. A status of zero (0) indicates a success. Any other value indicates an error.

Reset Configuration 0x000B

SwitchKit Name	ResetConfig
Type	API and SwitchKit API message
Description	<p>Reset Configuration 0x000B</p> <p>This message resets a card's configuration to the default values by corrupting the battery-backed configuration and initiating a hardware reset on the local processor. To reset the configuration on a CSP Matrix Series 3 Card, all cards must be specified and the force flag must be set.</p> <p>This message is useful for completely reinitializing the CSP or any component in the CSP. Generally, it should not be used on a live system.</p> <p>For SwitchKit, if you have included <i>ResetConfig</i> messages in your configuration file, the <i>ConfigStage</i> must be set to 10 for a reset to be performed. If the <i>ConfigStage</i> is anything other than 10, the reset is ignored.</p>
Sent by	Host

SwitchKit Code Configuration

```
ResetConfig (
    Node = integer,
    Slot = integer,
    ForcedFlag = integer);
```

C Structure

```
typedef struct {
    UBYTE Slot;
    UBYTE ForcedFlag;
} XL_ResetConfig;
```

C++ Class

```
class XLC_ResetConfig : public XLC_OutboundMessage {
public:
    UBYTE getSlot() const;
    void setSlot(UBYTE x);
    UBYTE getForcedFlag() const;
    void setForcedFlag(UBYTE x);
};
```

3, 4	Message Type (0x000B)	3, 4	Message Type (0x000B)
5	Reserved (0x00)	5	Reserved (0x00)
6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
8	<u>AIB</u>	8, 9	Status MSB, LSB
:	Address Method	10	Checksum
	0x00 - Individual AEs		
	Number of AEs to follow		
	AEs		
	0x01 Slot		
	The location of the line card to be reset (0xFF = all cards in the system)		
:	Force Flag		
	0xFF: Card configuration will be reset even if it has spans in service. All cards in the system will have their configuration reset.		
	If this flag is not set, messages sent to a card with spans in service fail, and the host receives a Response Status of 0x72 (Span In Service).		
:	Checksum		

Notes:

1. When resetting a line card's configuration, the host must wait for a *Card Status Report* message on the specified line card before considering its configuration reset.
2. Switchover will occur if all cards in the system are specified and there is a standby CSP Matrix Series 3 Card present.
3. The CSP Matrix Series 3 Card that gains control of the system after you send the *Reset Configuration* message becomes the active CSP Matrix Series 3 Card. This CSP Matrix Series 3 Card may not necessarily be the one that was active before you sent the message.

Reset IP Signaling Series 3 Card 0x0107

Type	EXS API message
Description	<p>Reset IP Signaling Series 3 Card 0x0107</p> <p>This message resets the IP Signaling Series 3 card before and/or after the IP Signaling Series 3 Card Interface is established. This message is sent directly to the IP Signaling Series 3 card and uses the extended logical node ID format.</p> <p>You can also reset the IP Signaling Series 3 card using the <i>Reset Configuration 0x000B</i> message once the IP Signaling Series 3 Card Interface is established.</p>
Sent by	Host
Example Message	<p>The follow sample resets the IP Signaling Series 3 card when the IP Signaling Series 3 card ID or Matrix ID is not assigned.</p>

Reset Matrix 0x009D

SwitchKit Name ResetMatrix

Type EXS API or SwitchKit API message

Description **Reset Matrix 0x009D**

This message is used by the host to force a matrix to reset. If the host sends it to the active CSP Matrix Series 3 Card in a redundant system, it will result in a CSP Matrix Series 3 Card switchover. A switchover can also be initiated by sending a *Become Active* message to the standby CSP Matrix Series 3 Card.

Sent by Host

Tag/Length/Value Blocks

Only one format of the Address Element Block TLV is required.

If the TLV contains the data type of Expanded Span/Channel, then the message is querying attributes of an established call.

If the TLV contains the data type of IP Address, then the message is querying default attributes of all channels associated with a particular DSP.

Message TLVs Address Element TLV Block
(for the Expanded Span/Channel AIB)

Byte	Description
0, 1	Tag: Address Element Block (0x0009)
2, 3	Length: 0x0005
4	Value: Data[0] AIB Type: Expanded Span/Channel (0x0D)
5	Value: Data[1] AIB Length (0x03)
6	Value: Data[2] Logical Span (MSB)
7	Value: Data[3] Logical Span (LSB)
8	Value: Data[4] Channel

Address Element TLV Block
(for the IP Address AIB)

Byte	Description
0, 1	Tag: Address Element Block (0x0009)
2, 3	Length: 0x0006
4	Value: Data[0] AIB Type: (0x3E: IP Address)
5	Value: Data[1] AIB Length (0x04)
6	Value: Data[2] IP (MSB)
7	Value: Data[3] IP
8	Value: Data[4] IP
9	Value: Data[5] IP (LSB)

Resource Connect 0x0127

SwitchKit Name ResourceConnect

Type EXS and SwitchKit API message

Description **Resource Connect 0x0127**

Use this message to connect to a resource.

Connect to a Child Conference

Use the Channel AIB and the Child Conference AIB. The Channel AIB indicates the Channel to be moved from the parent conference to the child conference. The Child Conference ID AIB indicates both the parent and child conference IDs.

NOTE: For the SwitchKit code, you must specify the span and channel before you specify the conference ID.

Resource Create 0x0124

SwitchKit Name Resource Create

Type EXS and SwitchKit API message

Description **Resource Create 0x0124**

Use this message to create a processing resource in the CSP.

Conference

To create a Unified conference, you send the following:

AIB: DSP Chip

Resource Type TLV: Conference

TLVs

Channel/DSP Pool

Conference Size

Monitor Conference Enable (to create a Monitor Conference)

Any optional conference TLVs

The Conference ID is returned in the response.

Child Conference

To create a Child Conference, you send the following:

AIB: Child Conference ID

TLVs

Resource Type: Child Conference

Any optional conference TLVs

The Child Conference ID is returned in the response.

Resource Delete 0x0126

SwitchKit Name	ResourceDelete
Type	EXS API and SwitchKit API message
Description	<p>Resource Delete 0x0126</p> <p>Use this message to delete a processing resource.</p>

Deleting a Conference

If forced deletion of a child conference is specified, the child conference is deleted immediately and the parties are connected back to the parent conference. If graceful deletion of a child conference is specified, then the child conference is deleted only after all the parties connected to it are disconnected. If the Forced Delete TLV is not used, graceful deletion is the default behavior.

When you use this message to delete a child conference, you must use the Child Conference ID AIB to address the child conference that needs to be deleted. If the child conference ID is specified as FFFF, then all the child conferences for the particular parent conference are deleted.

Resource Delete Indication 0x0129

SwitchKit Name

Type EXS API and SwitchKit API message

Description **Resource Delete Indication 0x0129**

This message indicates that a resource has been deleted.

Conferencing

When a child conference has been deleted, this message uses the Child Conference ID AIB as well as the mandatory AIB Container TLV (0xE003).

Sent by CSP

Resource Disconnect 0x0128

SwitchKit Name ResourceDisconnect

Type EXS and SwitchKit API message

Description **Resource Disconnect 0x0128**

Use this message to disconnect a processing resource, which was previously connected using the *Resource Connect* message.

FAX

Use this message to disconnect a fax channel in order to interrupt fax processing on that channel.

Conferencing

Use this message to move a channel from a Child Conference back into the Parent Conference. Use the Channel AIB and the Child Conference AIB. The Channel AIB indicates the Channel to be moved from the child conference to the parent conference. The Child Conference ID AIB both the parent and child conference IDs.

Resource Information Notify 0x0141

SwitchKit Name	ResourceInfoNotify
Type	EXS and SwitchKit API message
Description	Resource Information Notify 0x0141 Use this message to connect to a resource.

Connecting to a different resource types

Use this generic message to specify different Resource Types. When used for Frequency Shift Keying (FSK), the mandatory Resource Type TLV 0x0602 will be set to either Send SMS (0x010C) or Receive SMS (0x010D) and from the Switch to notify the Host of the SMS data received by the DSP Series 2 card.

Resource Query 0x012C

SwitchKit Name ResourceQuery

Type EXS and SwitchKit API message

Description **Resource Query 0x012C**

Use this message to query different configuration parameters that have been set for a particular channel (or any other entity used as an A-resource) using the *Resource Connect* (0x0127), *Resource Create* (0x0124), or *Resource Modify* (0x0125) messages.

You can use this message to query fax configuration parameters set for a particular channel on a per-call basis. These optional fax configuration parameters would have been configured while initiating a fax call, using the *Resource Connect* message (0x0127).

Note: To query configuration parameters that have been set at the card level using the *Generic Card Configure* (0x0122) message, use the *Generic Card Query* message (0x023).

Resource Release Indication 0x012E

SwitchKit Name ResourceReleaseIndication

Type EXS and SwitchKit API message

Description **Resource Release Indication 0x012E**

Use this message to connect to a resource.

Connecting to a different resource types

Use this generic message to specify different Resource Types. When used for Frequency Shift Keying (FSK), the mandatory Resource Type TLV 0x0602 will be set to either Send SMS (0x010C) or Receive SMS (0x010D) and sent from the Switch to the Host to indicate a SMS call release at the Data Link Layer.

Sent by Switch application

Related API Messages *Resource Create* (0x0124)

Response Data Ring Configuration Query

When querying the ring configuration, the following Data is returned.

Response Fields For Ring Configuration Query
Data[0] Number of Rings Configured
Data[1] Number of Unconfigured Nodes
Data[2] Logical Ring ID
Data[3] Ring Service State
Data[4] Number of Nodes on ring
Data[5] Ring Master Node ID
Data[6-9] Physical Node ID
Data[10-13] IP Address
Data[14] Logical Node ID
Data[15] Load Major Rev.
Data[16] Load Minor Rev.
Data[17] Load Build Number
Data[18] Transmit/Receive Mode

- Data[1] through Data[18] are repeated for each ring.
- Data[6] through Data[18] are repeated for each node on the ring.

Ring Status Report 0x0072

SwitchKit Name	RingStatusReport
Type	EXS API and SwitchKit API message
Description	Ring Status Report 0x0072 This message informs the host of a ring's status after its EXNET® status changes.
Sent by	CSP

Redundancy State This field indicates redundancy state of the RICs:

- 0x00 No Redundancy
- 0x01 Active RIC
- 0x02 Standby RIC
- 0xFF Role Not Yet Defined

Current Ring Mode This field indicates the Ring Mode:

- 0x00 Normal Ring Mode
- 0x01 Enhanced Fault Tolerance Ring Mode

Route Control 0x00E8

SwitchKit Name Route Control

Type EXS API and SwitchKit API message

Description **Route Control 0x00E8**

Use this message to outseize to a channel using the CSP Call Control. If you want to the host application to choose the span/channel, use the *Outseize Control* message instead of this message.

Contact Dialogic Technical Support if you want to send a *Route Control* message greater than 512 bytes.

Sent by Host

Protocol-Specific Considerations

This section provides protocol-specific considerations to help you use this message for VoIP calls. Note that these are examples and that there are several other ways to use the *Route Control* message.

The mandatory TLVs are listed for each ICB, but other protocol specific TLVs are mandatory in order to initiate an outbound call. Moreover, you may include additional optional TLVs as needed.

SIP

For physical SIP calls, the *Route Control* message must contain the following:
AIB - 0x0029 - Generic Router

Extended ICBs

0x001E Generic PPL ICB

0x0013 Routing Method TLV
Value: 0x0008 Criteria Type

0x000F Router Protocol ID TLV
Value: 0x000B Default Router

0x0008 Criteria Type TLV
Value: 0x0065 Physical VoIP Channel

0x0065 Physical VoIP Channel TLV
Value: 0x0000 (reserved)

Route Control 0x00E8

0x0033 NPDI Universal ICB

0x277E Remote Side Protocol TLV

Value: 0x08 - SIP

H.323

For H.323 calls, the *Route Control* message must contain the following:

AIB - 0x0029 - Generic Router

Extended ICBs

0x001E Generic PPL ICB

0x0013 Routing Method TLV
Value: 0x0008 Criteria Type

0x000F Router Protocol ID TLV
Value: 0x000B Default Router

0x0008 Criteria Type TLV
Value: 0x0065 Physical VoIP Channel

0x0065 Physical VoIP Channel TLV
Value: 0x0000 (reserved)

0x0033 NPDI Universal ICB

0x277E Remote Side Protocol TLV
Value: 0x09H.323

0x27C2 Remote End Signaling IP Address (Q.931) TLV
Value: IP Address

SIP Call Agent

For Call Agent calls, the *Route Control* message must contain the following:

AIB - 0x0029 - Generic Router

Extended ICBs

0x001E Generic PPL ICB

0x0013 Routing Method TLV
Value: 0x0008 Criteria Type

0x000F Router Protocol ID TLV
Value: 0x000B Default Router

0x0008 Criteria Type TLV
Value: 0x0071 Virtual VoIP Channel

0x0071 Virtual VoIP Channel TLV
Value: 0x0000 (reserved)

0x0033 - NPDI Universal ICB

0x277E Remote Side Protocol TLV
Value: 0x08SIP

Interworking

For Interworking calls, the *Route Control* message must contain the following:

AIB - 0x0029 - Generic Router

Extended ICBs

0x001E Generic PPL ICB
0x0013 Routing Method TLV
Value: 0x0008 Criteria Type

0x000F Router Protocol ID TLV
Value: 0x000B Default Router

0x0008 Criteria Type TLV
Value: 0x0065 Physical VoIP Channel

0x0065 Physical VoIP Channel TLV
Value: 0x0000 (reserved)

0x0033 NPDI Universal ICB
0x277E Remote Side Protocol TLV
Value: 0x08SIP

Clear Channel VoIP

For Clear Channel VoIP calls, the *Route Control* message must contain the following:

ICBs

0x001E Generic PPL ICB or 0x1E Generic PPL ICB

0x0013 Routing Method TLV
Value: 0x0009 Terminating Channel

0x0009 Terminating Channel TLV

Refer to the *Developer's Guides* for examples that include the *Route Control* message.

unsigned short getUpdatedFieldBits();
void setUpdatedFieldBits(unsigned short x);
};

```

Conditions for Sending the ServerStatusChange Message

The following list shows the conditions that will cause the LLC to send a *ServerStatusChange* message:

- SK_PM_CHANGE - sent when the first poll is received by the LLC for a CSP Matrix Series 3 Card. Also sent any time a value changes in the Poll. The UpdatedFieldBits field indicates which fields have changed since the last poll. The following is a possible scenario:
 1. The adjacent matrix has lost connection to the LCC running on the host. Either the LAN connection is severed or the host has severe CPU deprivation. Diagnose the LAN connection. Determine if the matrix card can receive and return ping messages. If the LAN connection is good, check the performance of the host.
- SK_SSC_UPDATE - sent under the following conditions:
 1. When an application registers for the ServerStatusChange notification via *sk_msgRegister()*, an SSC_UPDATE is sent for each node the LLC is currently connected to which has a CSP Matrix Series 3 Card in the active state.
 2. When an application issues an *AddLLCNode*, an SSC_UPDATE may be generated if the LLC already knew about the node and the LLC is currently connected to the active CSP Matrix Series 3 Card for that node. In other words, if the Link is considered to be up.

- SK_LINK_UP - sent under the following conditions:
 1. This message is sent to indicate that there is a connection to the active CSP Matrix Series 3 Card for this node and the CSP Matrix Series 3 Card is ready to be configured. This will be sent if this is a new condition (i.e. we were not previously connected to the active CSP Matrix Series 3 Card).
 2. Sent if an application has performed an *AddLLCNode*, the LLC is currently connected to the specified node, and the LLC is connected to the active CSP Matrix Series 3 Card of that node.
 3. When an application registers for the *ServerStatusChange* notification via *sk_msgRegister()*, and the LLC is connected to the active CSP Matrix Series 3 Card of a node.
- SK_LINK_DOWN - sent under the following conditions:
 1. This message is sent to indicate that there is NO connection to the active CSP Matrix Series 3 Card for a node. This will be sent if this is a new condition (that is, we were previously connected to the active CSP Matrix Series 3 Card).
 2. Sent if an application has performed an *AddLLCNode*, and the LLC is not currently connected to the specified node's active CSP Matrix Series 3 Card.
 3. When an application registers for the *ServerStatusChange* notification via *sk_msgRegister()*, and the LLC is supposed to be connected to a node but is not connected to the node's active CSP Matrix Series 3 Card.

More on SK_LINK_UP and SK_LINK_DOWN

- Registering for *ServerStatusChange* will result in an SK_LINK_UP or SK_LINK_DOWN for each node controlled by the LLC. If an SK_LINK_UP is sent, it will be followed by an SK_SSC_UPDATE with the last poll from the active CSP Matrix Series 3 Card.
- Performing an *AddLLCNode* will result in an SK_LINK_UP or SK_LINK_DOWN for the specified node if the LLC is already controlling the node. If an SK_LINK_UP is sent, it will be followed by an SK_SSC_UPDATE with the last poll from the active CSP Matrix Series 3 Card, if the LLC is currently connected to the CSP Matrix Series 3 Card in the active state.

- SK_PM_CHANGE, SK_SOCKET_CHANGE, SK_LINK_UP and SK_LINK_DOWN are generated to indicate a change in state.
- SK_NSQ_CHANGE or SK_NSR_CHANGE are generated upon arrival of *NodeStatusQueryAck* or *NodeStatusReport* from the CSP.

Arguments

The following table indicates what arguments are valid for a specific message trigger:

MessageTrigger	Argument	Description
SK_PM_CHANGE or SK_SSC_UPDATE	PhysicalNode	Represents the requested Node ID
	LogicalNode	Represents the current Node ID as reported by the CSP in <i>PollMessage</i>
	SocketStatus	1 always. Socket must be connected for this indication to occur.
	Status	Status from <i>PollMessage</i>
	SystemType	System Type(Poll Source) from <i>PollMessage</i>
	MatrixSide	CSP Matrix Series 3 Card ID from <i>PollMessage</i>
	MatrixState	Matrix State(Card State) from <i>PollMessage</i>
	AdjMatrixState	Adjacent Card State from <i>PollMessage</i>
	StatusBits	Card Status from <i>PollMessage</i>
	CSP Port	Double Byte after Multi Host Connection Status Byte 2 in <i>PollMessage</i>
	UpdatedFieldBits	Bit mask indicating which fields in the poll were updated. See table below for details of the meaning of the bits. Only set for SK_PM_CHANGE
SK_LINK_UP or SK_LINK_DOWN	PhysicalNode	Requested Node ID
	LogicalNode	Requested Node ID

Constants The following table contains information for the field UpdatedFieldBits. You can combine any number of settings in this bit mask:

Constants	Changed Argument in <i>Server StatusChange</i> message
SK_STATUS_CHANGE	Status
SK_SYSTEMTYPE_CHANGE	SystemType
SK_MATRIXSIDE_CHANGE	MatrixSide
SK_MATRIXSTATE_CHANGE	MatrixState
SK_ADJMATRIXSTATE_CHANGE	AdjMatrixState
SK_STATUSBITS_CHANGE	StatusBits
SK_LOGICALNODE_CHANGE	LogicalNode

Service State Configure 0x000A

SwitchKit Name ServiceStateConfig

Type EXS API and SwitchKit API message

Description **Service State Configure 0x000A**

This message allows the host to bring an entity (a card, span, channel, range of channels, DSP SIMM, or SS7-controlled circuit) in and out of service. On the DSP Series 2 card, this message must use AIB 0x22 to take an individual DSP chip in and out of service.

A card is automatically brought into service when the system is powered up. The host does not have to bring a card into service unless it has previously taken the card out of service using this message.

DS3 Card

The DS3 framer is automatically brought into service when the DS3 card is brought into service. Once in service, DS3 status changes are reported to the host in the *Alarm* messages (0x00B9). If the DS3 circuit is not ready for operation, the host can disable DS3 alarms by placing the DS3 framer out of service. To do this, have the host send a *Service State Configure* message with the DS3 Offset AIB (0x32) and an action of 0x0F (Take Out of Service).

If the host does take the DS3 Framer Out of Service, it is the host's responsibility to bring it back in service. If the host does not bring the DS3 Framer back in service, the CSP will send a NACK 0x005A (DS3 Out of Service) when it receives the *Service State Configure* message to Brings Span In Service.

The DS3 Offset AIB must always be 0.

LAPD Super Rate

For LAPD Super Rate, this message must address the first D channel (DS0). The other D channels in the Super Rate D channel do not need to be addressed in *Service State Configure*.

Virtual Cards

You cannot use *Service State Configure* to take virtual cards out-of-service.

Alarm and Alarm Cleared messages

The CSP sends an *Alarm* message (0x00B9) to the host when the cards are taken out of service (OOS). When cards are brought back in service, the CSP sends an Alarm Cleared (0x00C1) message to the host.

For DSP modules, the CSP sends and Alarm Clear message to the host when the DSP Module is brought in service.

This functionality applies to all CSP cards except the following:

- I/O cards
- CSP Matrix Series 3 Card
- Virtual cards

The CSP sends information about the cards to the host in the *Card Status Report* message (0x00A6). Host applications act based on the Alarm and Alarm Cleared messages received from the CSP. This feature allows the application to track card status and take action without modifying the application.

Sent by Host

**Example Message
(Socket Log Output)**

The following example message (socket log output for SwitchKit) takes channels 0x01 through 0x05 on span 0x01 out of service.

```
00 13 00 0A 00 00 FF 01 02 0D 03 00 01 01 0D 03 00 01 05 0F 00
```

Configuration

```

	Use this flag to determine the way a SIMM is taken out of service. The meaning of this field depends on the entity being addressed.		
	0x04 DSP SIMM		
	0x01 Take a DSP SIMM out of service, even if it is currently being used. When you force a DSP SIMM out of service, you receive no alarm.		
	0x00 Take a DSP SIMM out of service gracefully. When you take a DSP SIMM out of service gracefully, you receive a DSP SIMM OOS Alarm.		
	For all other entities: Reserved, must be 0x00.		
:	Checksum		

Invalid Responses

NOTE: These invalid responses apply to the V5 ID address type only

- 0x01-The host could be attempting to bring the V5 interface in service or out of service when the V5 Interface ID (4 bytes) has not been configured. The host could be attempting to bring the V5 interface in service or out of service when the V5 ID is not configured.
- 0x04- The host could be attempting to bring the V5 interface in service when the V5 Variant ID has not been configured for that interface.
- 0x07-The host could be attempting to bring the V5 interface in service when no user ports are configured for the V5 ID.
- 0x0A-The host could be attempting to bring the V5 interface in service when no C Channels are assigned to this V5 ID.
- 0x0B-The host was attempting to bring a V5 interface in service when a C Channel was found on an unconfigured link.
- 0x0DRESERVED
0x0ERESERVED
0x0FRESERVED

Notes:

- 1 When a DS3 is taken out of service, the CSP automatically takes all spans and channels on the DS3 out of service. When the DS3 is brought back in service, the spans and channels are *not* automatically brought back in service. You must manually bring the spans and channels in service. A DS3 must be in service before any spans can be brought in service. The CSP returns a status of *DS3 Out of Service* (0x5A) if you attempt to bring a span in service first.
- 2 When bringing a card in service that was previously out of service, the host must wait for a *Card Status Report* message on the appropriate slot before considering the card in service.
- 3 When a span is taken out of service, all channels on the span are automatically taken out of service by the CSP. When the span is brought back in service using this message, the channels are not automatically brought back in service. You must send this message again to bring the channels back into service.
- 4 The host should not consider a channel in service upon receiving the Response to this message. The host must

receive a *DSO Status Change* message with status of “In Service” before considering the channel in service.

- 5 If you are using E1 Channel 30 for purposes other than CAS (for example, CCS), you cannot include it in a range with other channels. Instead, you must bring E1 Channel 30 into service with a single separate *Service State Configure* message. Be sure that both the starting and ending spans and channels are set to the span and channel 30.
- 6 If you take an E1 PPL channel out of service using this message, the host receives the following:
 - A *DSO Status Change* message (0x42) that has a *Channel Status* field value of 0x01 (Out of Service).
 - A *DSO Status Change* message (0x42) that has a *Channel Status* field value of 0x00 (Purge) and a *Purge Reason* field value of 0x74 (Disabled While Non-dormant).The system sends this second message to the host as a result of meeting certain criteria but does not actually perform a purge. You can ignore this second message.

SNMP Configure 0x0092

SwitchKit Name SNMPConfig

Type EXS API and SwitchKit API message

Description **SNMP Configure 0x0092**

This message uses the *Generic Report* message (0x46) to send statistical information to the CSP.

Sent by Host

SwitchKit Code **C Structure**

```
typedef struct {

Span Filter Query 0x00CE

SwitchKit Name SpanFilterQuery

Type EXS API and SwitchKit API message

Description **Span Filter Query 0x00CE**

This message is used to query the values of the CGA detected and cleared validation timers

The “CGA Detected” validation timer determines how long a CGA alarm must be detected before the CSP informs the host with an *Alarm* message. The default is 2.5 seconds. The host will also receive a *DSO Status Change* message of “Out Of Service” for the channels on the span.

The “CGA Cleared” validation timer is initiated after a CGA alarm has been detected and then clears. It determines how long the CSP must go without detecting a CGA alarm before informing the host with an *Alarm Cleared* message. The default is 12 seconds. The host will also receive a *DSO Status Change* message of “In Service” for the channels on the span.

Span Status Query 0x0084

SwitchKit Name	SpanStatusQuery
Type	EXS API and SwitchKit API message
Description	<p>Span Status Query 0x0084</p> <p>This message may be used by the host to obtain information about the state of an in-service T1 or E1 span. It resets bipolar violations and frame error contents.</p> <p>For the SS7 Multi-Protocol I/O card, the positive acknowledgement to this query contains zeros in the data fields.</p>
Sent by	Host

CIC Assignment over E1

For CIC assignments over E1, the base channel refers to the Dialogic channel shown in the table below. The number of CICs defines the CIC range using the contiguous timeslots as the range. In the example table below there is no signaling link on the span. There is a base CIC of 0x00 and 31 CICs that can be configured as one group. If there is a signaling link on the span on a

timeslot other than timeslot 1 (Dialogic channel 0x00) then the CIC configure has to be split in two groups.

Note that this table is an example and reflects one way to assign CICs over E1.

Dialogic Channel	Timeslot	Full-span No SS7 Link	Last Channel Used as SS7 Link	First Channel Used as SS7 Link
31	0	-	-	-
0	1	0x00	0x00	SS7 Link

Call Control User Part

Japanese ISUP CIC Mapping Options

If you select ISUP/Japanese ISUP CIC Mapping (0x02), you must map CICs according to one of the following three options:

- Full span
- Last channel not used as CIC

- First channel not used as CIC

The values of the channels based for each option above are shown in the table below.

CSP Channel	Timeslot	Full-span No SS7 Link	Last Channel Used as SS7 Link	First Channel Used as SS7 Link
31	0	Frame Alignment Signal		
0	1	Base CIC + 0	Base CIC + 0	Not used as CIC (may be SS7 link)
1	2	Base CIC + 6	Base CIC + 6	Base CIC + 5
2	3	Base CIC + 12	Base CIC + 12	Base CIC + 11
3	4	Base CIC + 18	Base CIC + 18	Base CIC + 17
4	5	Base CIC + 24	Base CIC + 24	Base CIC + 23
5	6	Base CIC + 1	Base CIC + 1	Base CIC + 0
6	7	Base CIC + 7	Base CIC + 7	Base CIC + 6
7	8	Base CIC + 13	Base CIC + 13	Base CIC + 12
8	9	Base CIC + 19	Base CIC + 19	Base CIC + 18
9	10	Base CIC + 25	Base CIC + 25	Base CIC + 24
10	11	Base CIC + 2	Base CIC + 2	Base CIC + 1
11	12	Base CIC + 8	Base CIC + 8	Base CIC + 7
12	13	Base CIC + 14	Base CIC + 14	Base CIC + 13
13	14	Base CIC + 20	Base CIC + 20	Base CIC + 19
14	15	Base CIC + 26	Base CIC + 26	Base CIC + 25
30	16	Cannot Be Used		
15	17	Base CIC + 3	Base CIC + 3	Base CIC + 2
16	18	Base CIC + 9	Base CIC + 9	Base CIC + 8
17	19	Base CIC + 15	Base CIC + 15	Base CIC + 14
18	20	Base CIC + 21	Base CIC + 21	Base CIC + 20
19	21	Base CIC + 27	Base CIC + 27	Base CIC + 26
20	22	Base CIC + 4	Base CIC + 4	Base CIC + 3
21	23	Base CIC + 10	Base CIC + 10	Base CIC + 9

29	31	Base CIC + 29	Not used as CIC (may be SS7 link)	Base CIC + 28

Response Data

The meaning of these fields depends upon the value of the *Entity* field in the message. The following value can be received:

- 0x7F Software module still locked.
This value is returned when attempting to configure a locked module for which no product license has been downloaded.

0xFD Node ID Not Configured

This response is a result of an SS7 server node configuration. Assignment of spans failed because node is not yet assigned. When sending the *SS7 CIC Configure* message (0x006A) over the EXNET® ring, this response value indicates the Ethernet connection is not available to the SS7 I/O card and you should check the connection.

CRG	0x31		NRM	0x32			

Repeatable Optional Parameters/Optional Parameters Allowed

This field informs ISUP whether or not to look for or insert the optional parameters pointer octet in the ISUP message.

Some messages allow optional parameters, even though optional parameters are not defined (for example, the ITU Q.767 Release Complete (RLC) message).

- Optional parameters are required for the incoming message when you set the value of the *Optional Parameters Allowed* field to **0x01**. This is the default value. When you set this value to **0x01** and optional parameters are included in the message, the CSP automatically inserts the *End of Optional Parameters* octet. If the optional parameter pointer is missing in the incoming message, the CFN (Confusion message) will be returned.
- The maximum number of Optional Parameters is 52.
- For no optional parameters, set the value of the *Optional Parameters Allowed* field to **0x00** and the value of the *Number of Optional Parameters* field to **0x00**. You must complete this step to support the pre-1995 ANSI format for the Group Reset (GRS) and Group Reset Acknowledgement (GRA) messages.

Example: API message:

00 1f 00 6b 00 00 ff 00 01 08 01 00 10 17 00 00 01 16 01 01 01 00
00 02 4e 21 00 01 01 4e 22 00 01 01

00 1f 00 6b 00 00 ff 00 01 08 01 00 11 29 00 00 01 16 01 04 00 00
02 4e 21 00 01 01 4e 22 00 01 01

Example: SwitchKit API:

SS7ISUPMessageFormatConfig(note=0
StackID=0,
ISUPMessageIndex=10
ISUPmessageid=0x17
ISUPMessagePriority=0
NumMFPs=0,
Data=1:22:1:4:0:0:2:0x4e:0x21:00:01:01:0x4e:0x22:00:01:01);

SS7ISUPMessageFormatConfig(node=0,
StackID=0
ISUPMessageIndex=0x11
ISUPmessageid=0x29
ISUPMessagePriority=0
NumMFPs=0
Data=1:22:1:4:0:0:2:0x4e:0x21:00:00:01:01:0x4e:0x22:00:01:01);

- For Repeatable Optional Parameters, set the value of this field to the number of repeated optional parameters.

MSB	LSB
Bits 7-1 Number of Repeatable Optional Parameters Indicator	Bit 0 Optional Parameters Indicator

Options for Optional Parameters Allowed Indicator

- 0 Optional Parameters Not Allowed
- 1 Optional Parameters Allowed

Options for Number of Repeatable Optional Parameters

- 0 No Repeatable Optional Parameters
- 1 -127 Indicate the number Repeatable Optional Parameters

Maximum Length

A value of 0x00 for the maximum length fields indicates that no validation is performed for the maximum length of the parameter.

Repeatable Optional Parameters/Optional Parameters Allowed

This field informs ISUP whether or not to look for or insert the optional parameters pointer octet in the ISUP message.

Some messages allow optional parameters, even though optional parameters are not defined (for example, the ITU Q.767 Release Complete (RLC) message).

- To include optional parameters, set the value of the *Optional Parameters Allowed* field to **0x01**.
When you set this value to 0x01 and optional parameters are included in the message, the CSP automatically inserts the *End of Optional Parameters* octet.
- For no optional parameters, set the value of the *Optional Parameters Allowed* field to **0x00** and the value of the *Number of Optional Parameters* field to **0x00**.
- For Repeatable Optional Parameters, set the value of this field to the number of repeated optional parameters.

MSB	LSB
Bits 7-1 Number of Repeatable Optional Parameters Indicator	Bit 0 Optional Parameters Indicator

Options for Optional Parameters Allowed Indicator

- 0 Optional Parameters Not Allowed
- 1 Optional Parameters Allowed

Options for Number of Repeatable Optional Parameters

- 0 No Repeatable Optional Parameters
- 1 -127 Indicate the number Repeatable Optional Parameters

Maximum Length

A value of 0x00 for the maximum length fields indicates that no validation is performed for the maximum length of the parameter.

SS7 SCCP/TCAP Configure 0x0077

SwitchKit Name SS7SCCPTCAPConfig

Type EXS API and SwitchKit API message

Description **SS7 SCCP/TCAP Configure 0x0077**

This message is sent to configure options for SS7 SCCP/TCAP.

For SwitchKit

Those options include:

- Local SSN
- Adjacent Translator
- Other Concerned Point Code
- SCCP Default Parameter Table
- SSN Default Parameter Table
- Network DPC/SSN
- SCCP/TCAP host configuration

In a SwitchKit environment, this message must be sent by an application or by SwitchManager with ConfigType = 1, Data = [2:1] specifying “SCCP route message to TCAP”. Without sending this message first and receiving a positive acknowledgment it is impossible to add or specify a node as a TCAP node.

Sent by Host (SwitchManager for SwitchKit)

Overview of message The following table provides an overview of this message. The table following it provides the detail for each byte.

SS7 Signaling Link Configure 0x005E

SwitchKit Name SS7SignalingLinkConfig

Type EXS API and SwitchKit API message

Description **SS7 Signaling Link Configure 0x005E**

This message defines a signaling link and assigns it to a link set. You can also use this message to subsequently deconfigure a signaling link.

Sent by Host

Example Message (Socket Log Output for SwitchKit)

The following example message defines signaling link 0x05 on a primary SS7 card. The signaling link is assigned to link set 0x23. The link's data rate is 64 Kbps rate and the electrical interface is V.35 DTE (Data Terminal Equipment).

```
00 14 00 5E 00 00 FF 00 02 1F 03 00 23 05 0D 03 00 01 17 01 00 01
```

SwitchKit Code **Configuration**

```
SS7SignalingLinkConfig (
    Node = integer,
    StackID = integer,
    LinkSetID = integer,
    LinkID = integer,
    Span = integer,
    Channel = integer,
    SLC = integer,
    DataRate = integer,
    ElectricalInterface = integer,
```

C Structure

```
typedef struct {
    UBYTE AddrInfo[4];
    UBYTE StackID;
    UBYTE LinkSetID;
    UBYTE LinkID;
    unsigned short Span;
    UBYTE Channel;
    UBYTE SLC;
    UBYTE DataRate;
    UBYTE ElectricalInterface;
    UBYTE Reserved;
} XL_SS7SignalingLinkConfig;
```

C++ Class

```
class XLC_SS7SignalingLinkConfig : public
    XLC_OutboundMessage {
```

```

public:
    const UBYTE *getAddrInfo() const;
    UBYTE *getAddrInfo();
    void setAddrInfo(UBYTE *x);
    UBYTE getStackID() const;
    void setStackID(UBYTE x);
    UBYTE getLinkSetID() const;
    void setLinkSetID(UBYTE x);
    UBYTE getLinkID() const;
    void setLinkID(UBYTE x);
    unsigned short getSpan() const;
    void setSpan(unsigned short x);
    UBYTE getChannel() const;
    void setChannel(UBYTE x);
    UBYTE getSLC() const;
    void setSLC(UBYTE x);
    UBYTE getDataRate() const;
    void setDataRate(UBYTE x);
    UBYTE getElectricalInterface() const;
    void setElectricalInterface(UBYTE x);
    UBYTE getReserved() const;
    void setReserved(UBYTE x);
};
    
```

SS7 Signaling Link Set Configure 0x005D

SwitchKit Name SS7SignalingLinkSetConfig

Type EXS API and SwitchKit API message

Description **SS7 Signaling Link Set Configure 0x005D**

This message allows the host to define and subsequently deconfigure a signaling link set, which is a load-sharing collection of signaling links connected to an adjacent signaling node. The link set and stack must be configured before the signaling links.

You can also set this message to deconfigure a link set.

Example Message (Socket Log Output for SwitchKit)

The following example message defines a signaling link set with an OPC for a signaling stack that uses 24-bit point codes (ANSI).

```
00 0F 00 5D 00 00 FF 00 01 1E 02 00 00 00 20 00 00
```

Sent by Host

SwitchKit Code **Configuration**

```
SS7SignalingLinkSetConfig (
    Node = integer,
    StackID = integer,
    LinkSetID = integer,
    APC = integer);
```

C Structure

```
typedef struct {
    UBYTE StackID;
    UBYTE LinkSetID;
    int APC;
} XL_SS7SignalingLinkSetConfig;
```

C++ Class

```
class XLC_SS7SignalingLinkSetConfig : public
    XLC_OutboundMessage {
public:
    UBYTE getStackID() const;
    void setStackID(UBYTE x);
    UBYTE getLinkSetID() const;
    void setLinkSetID(UBYTE x);
    int getAPC() const;
    void setAPC(int x);
};
```

	Number of AEs to follow		
	AEs 0x1E SS7 Link Set		
:	APC (four bytes) SS7 network address of the adjacent signaling node. Every point code in the API messages will always be 4 bytes long with the first byte (MSB) as zero. See the SS7 section of the <i>API Developer's Guide: CCS</i> for an explanation of how to convert the 4 bytes into ITU and ANSI point codes. 0x00000000–0x00FFFFFF The APC must be in this range for signaling stacks using a 24-bit point code (for example ANSI). 0x00000000–0x00003FFF The APC must be in this range for signaling stacks using a 14-bit point code (for example, ITU). 0xFFFFFFFF Indicates deconfiguration of the specified link set. You can perform deconfiguration only after each link and route previously assigned to the link set has been deconfigured.		
:	Checksum		

SS7 Signaling Link Set Query 0x0064

SwitchKit Name' SS7SignalingLinkSetQuery

Type EXS API and SwitchKit API message

Description **SS7 Signaling Link Set Query 0x0064**

This message allows the host to query information on a signaling link set.

NOTE: Every point code in API messages will always be 4 bytes long with the first byte MSB as zero. See *Signaling System 7* in the *API Developer's Guide: CCS* for an explanation of how to convert the 4 bytes for APC into ITU and ANSI point codes.

MESSAGE (White)		RESPONSE (Gray)	
Byte	Field Description	Byte	Field Description
0	Frame (0xFE)	0	Frame (0xFE)
1, 2	Length (0x00NN)	1, 2	Length (0x0007)
3, 4	Message Type (0x005F)	3, 4	Message Type (0x005F)
5	Reserved (0x00)	5	Reserved (0x00)
6	Sequence Number	6	Same Sequence Number
7	Logical Node ID	7	Logical Node ID
8	AIB Address Method 0x00 - Individual AEs	8	Status (MSB, LSB) The meaning of these fields depends upon the value of the <i>Entity</i> field in the message. If the MSB of the Status field is 0x01 (NACK), the LSB indicates the NACK reason. 0x01 SS7 invalid combined linkset reference. The Route ID given as the reference is not configured.
		9	Checksum
Number of AEs to follow AEs 0x20 SS7 Destination/Route Note: After you issue the first <i>SS7 Signaling Route Configure</i> message for a DPC, all subsequent <i>SS7 Signaling Route Configure</i> messages must use the same Destination ID within the AE for additional routes to the same DPC. (There is a unique association between DPC and an assigned Destination ID.)			
:	DPC (four bytes) Every point code in the API messages will always be 4 bytes long with the first byte (MSB) as zero. See the SS7 section of the <i>API Developer's Guide: CCS</i> for an explanation of how to convert the 4 bytes into ITU and ANSI point codes. 0x00000000–0x00FFFFFF The DPC must be in this range for signaling stacks using 24-bit point codes (for example, ANSI). 0x00000000–0x00003FFF The DPC must be in this range for signaling stacks using 14-bit point codes (for example, ITU). 0xFFFFFFFF Indicates de-assignment of the specified destination and all routes to the specified destination. This is the only method that can be used to de-assign a destination. If using the BT IUP protocol, the maximum range for a DPC is 14 bits.		
:	Link Set ID The Link Set that carries traffic for this route (0x00 – 0x1F). If the DPC field is not 0xFFFFFFFF, a value of 0xFF in this field indicates de-configuration of the specified route.		

SS7 Signaling Route Configure 0x005F

:	<p>Priority Signaling traffic is routed over available link sets according to the priority established by the host (0x00 is the lowest priority and 0x23 is the highest priority). Link sets with the same priority to a destination load share traffic as a combination link set.</p>
:	<p>Combined Linkset Reference Indicates that the route being configured and the route given in the reference are both part of a combined linkset.</p> <p>Data [0-1] Route ID is given as "Combined LinkSet Reference".</p> <p>Note: The route that has already been configured becomes the Combined LinkSet Reference. Also, if there are n routes already configured as a combined linkset to a destination, then the route for the same combined linkset can be configured by giving any of the n-route IDs as a Combined Linkset Reference.</p>
:	<p>Checksum</p>

SS7 Signaling Route Query 0x0066

SwitchKit Name SS7SignalingRouteQuery

Type EXS API and SwitchKit API message

Description **SS7 Signaling Route Query 0x0066**

This message retrieves the configuration and status of all indicated signaling routes. This message can also be used to query the Destination ID, given the Route ID.

Sent by Host

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE StackID;

SS7 Signaling Route Query 0x0066

8 :	<u>AIB</u> Address Method 0x00 - Individual AEs	8, 9	Status MSB, LSB
	Number of AEs to follow AEs 0x20 SS7 Destination/Route <u>Stack ID</u> When you supply a valid Destination ID with the query, this field must contain the associated Stack ID. When the Destination ID supplied is 0xFFFF, the Stack ID can contain any SS7 Stack ID that is configured, as long as the Stack ID indicated exists on the SS7 card being queried. (The application might not know the correct Stack ID for this Route ID.) <u>Destination ID</u> 0x0000 to 0x003F - Valid 0x0040 to 0xFFFF - Invalid. The message gets a NACK of 0xEC, "Invalid Route Mode." <u>Route ID</u> 0x0000 - 0x01FF	10	0x20 SS7 Destination/Route <u>Stack ID</u> 0x00 - 0x03 If a valid Destination ID was supplied with the query, this field will contain the same stack ID in the response and the one supplied in the query. If the Destination ID supplied in the query was 0xFFFF, this field will contain the correct stack ID for the Route ID supplied in the query (i.e. the stack ID in the response will be the correct one, even though the one in the query may have been incorrect.) 0xFF- If the Destination ID supplied in the query was 0xFFFF, a response stack ID of 0xFF indicates that the Route ID supplied in the query is not configured and does not have an associated Stack ID. <u>Destination ID</u> 0x0000 to 0x003F - The Destination ID associated with the Route ID supplied in the query. 0xFFFF - If the Destination ID supplied in the query was 0xFFFF, a response Destination ID of 0xFFFF indicates that the Route ID supplied in the query is not configured and does not have an associated Destination ID. <u>Route ID</u> 0x0000 - 0x01FF Note: If it is the Destination ID that is being queried, a positive acknowledgment simply indicates that the Route ID is within range. In this case, a positive acknowledgment will be returned whether this Route ID is configured or not.

SS7 Signaling Stack Configure 0x005C

SwitchKit Name SS7SignalingStackConfig

Type EXS API and SwitchKit API message

Description **SS7 Signaling Stack Configure 0x005C**

Use this message to define a signaling stack, which includes assigning an OPC and a variant. You can also use this message to deconfigure a signaling stack.

NOTE: PCM encoding for CICs controlled by the signaling stack is defaulted based on the network signaling variant. ANSI stacks default to u-law regardless of the physical link type. ITU stacks default to A-law. To change the encoding format see the PCM Encoding Format message.

For example, if you are configuring the ISUP Call Control User Part, then you would send this message with three sets of module <i>Type</i> and <i>Variation</i> fields: MTP, L3P, and ISUP.</p> <p>When using the BT IUP variant, the Module Variant is 0x02. You must also configure module types 0x01 and 0x03. For example, in an E1 configuration, you would specify Module Type 0x01 with a variant of 0x01, Module 3 with a variant of 0x01, Module 4 with a variant of 0x02, and Module 5 with a variant of 0x02.</p>
:	Module 1: Variant (see information below this table)
:	Module n: Type
:	Module n: Variant
:	Checksum

Module Variant The following variants are tested and supported.

Value	Description	Modules
0x00	ANSI '97	All Modules (except TUP or BT IUP)
0x01	ITU-TS '97	All Modules
0x02	BT IUP	Module Types 4 and 5 when BT IUP is required
0x03	SSUTR2	Module Types 4 and 5 when BT IUP is required
0x08	JT	Module Types 1, 2, and 3

SS7 Signaling Stack Query 0x006D

SwitchKit Name	SS7SignalingStackQuery
Type	EXS API and SwitchKit API message
Description	SS7 Signaling Stack Query 0x006D This message retrieves the configuration of an SS7signaling stack.
Sent by	Host
SwitchKit Code	C Structure

```
typedef struct {
    UBYTE StackID;
} XL_SS7SignalingStackQuery;
```

C Structure Response

```
typedef struct {
    unsigned short Status;
    UBYTE StackID;
    int OPC;
    UBYTE NumModules;
    UBYTE Data[216];
} XL_SS7SignalingStackQueryAck;
```

C++ Class

```
class XLC_SS7SignalingStackQuery : public
    XLC_OutboundMessage {
public:
    UBYTE getStackID() const;
    void setStackID(UBYTE x);
};
```

C++ Class Response

```
class XLC_SS7SignalingStackQueryAck : public
    XLC_AcknowledgeMessage {
public:
    unsigned short getStatus() const;

EXS API Hex Format

NOTE: The fields listed between the double lines in the table (*Field[m] ñ ID through Subfield[s] ñ Maximum Length, LSB*) are repeated for each mandatory field. Likewise, the fields listed between the thick lines in the table (*Field[o] ñ ID through Subfield[s] ñ Maximum Length, LSB*) are repeated for each optional field. Each mandatory and optional field can have a variable number of subfields. For example, Mandatory Field[0] can have 3 subfields, Mandatory Field[1] can have two subfields, and Optional Field[0] can have 4 subfields.

H0/H1 Length

The system uses the H0 and H1 fields as *x, y* coordinates for the Heading Code Allocations table found in the Q.723 specification.

This field indicates whether length of the *H0 Value* and *H1 Value* fields are defined as half-octets or octets (groups of 4 bits or 8 bits, respectively). Valid entries for this field are as follows:

- 0x01 Half-octets
- 0x02 Octets

H0/H1 Value

The system uses the H0 and H1 fields as *x, y* coordinates for the Heading Code Allocations table found in the Q.723 specification.

TUP This field represents the value of the H0 or H1 parameter in the Heading Code Allocations table. To represent the appropriate Heading Code, use the following H0 and H1 values:

Heading	H0	H1
IAM	0x01	0x01
IAI	0x01	0x02
SAM	0x01	0x03
SAO	0x01	0x04
GSM	0x02	0x01
COT	0x02	0x03
CCF	0x02	0x04

};
    
```

EXS API Hex Format

NOTE: The fields listed between (*Field[m] – ID* through *Subfield[s] – Maximum Length, LSB*) are repeated for each mandatory field. Likewise, the fields listed between (*Field[o] – ID* through *Subfield[s] – Maximum Length, LSB*) are repeated for each optional field.

Each mandatory and optional field can have a variable number of subfields. For example, Mandatory Field[0] can have 3 subfields, Mandatory Field[1] can have two subfields, and Optional Field[0] can have 4 subfields.

H0/H1 Length

The system uses the H0 and H1 fields as *x, y* coordinates for the Heading Code Allocations table found in the Q.723 specification.

This field indicates whether length of the *H0 Value* and *H1 Value* fields are defined as half-octets or octets (groups of 4 bits or 8 bits, respectively). Valid entries for this field are as follows:

- 0x01 Half-octets
- 0x02 Octets

H0/H1 Value

The system uses the H0 and H1 fields as *x, y* coordinates for the Heading Code Allocations table found in the Q.723 specification.

This field represents the value of the H0 or H1 parameter in the Heading Code Allocations table. To represent the appropriate Heading Code, use the following H0 and H1 values:

Heading	H0	H1
IAM	0x01	0x01
IAI	0x01	0x02
SAM	0x01	0x03
SAO	0x01	0x04
GSM	0x02	0x01

Standby Line Card Configure 0x0023

SwitchKit Name Standby Line Card Config

Type EXS API and SwitchKit API message

Description **Standby Line Card Configure 0x0023**

This message allows the host in a redundant system to configure a line card as a standby card. Only line cards that have Standby IO cards behind them can be designated as standby line cards. A *Card Status Report* message first informs the host which line card has a Standby I/O installed. The host must assign a line card as a standby before a switchover can occur.

Sent by Host

Example Message (Socket Log Output for SwitchKit)

In the following socket log output/example message, the host configures a T-ONE card to be a standby card:

```
00 0C 00 23 00 00 FF 00 01 01 01 0F 00 00
```

SwitchKit Code **Configuration**

```
StandbyLineCardConfig (
    Node = integer,
    Slot = integer,
    CardType = integer,
    Action = integer);
```

C Structure

```
typedef struct {
    UBYTE Slot;
    UBYTE CardType;
    UBYTE Action;
} XL_StandbyLineCardConfig;
```

C++ Class

```
class XLC_StandbyLineCardConfig : public XLC_SlotMessage
{
public:
    UBYTE getSlot() const;
    void setSlot(UBYTE x);
    UBYTE getCardType() const;
    void setCardType(UBYTE x);
    UBYTE getAction() const;
    void setAction(UBYTE x);
};
```

Statistics Query 0x0121

SwitchKit Name Statistics Query

Type EXS API and SwitchKit API message

Description **Statistics Query 0x0121**

NOTE: This message applies to the DSP Series 2 card only.

Use this message to query cache and function usage statistics that are kept on the DSP Series 2 card. The statistics are stored in cache for 16 days, and then they are replaced one-by-one with more recent statistics. At any time, you can view statistics for the past 16 days. You can configure the time to copy statistics into the buffer from one second to 86,400 seconds, in one-second increments.

This message does not support wildcards for the DSP Chip AIB, because the data that comes back from the CSP would be too long.

Sent by Host Application

SwitchKit Code **C Structure**

```
typedef struct {
    unsigned short Status;

SwitchBackFromStandby

Type	SwitchKit API message
Description	Use the <i>SK_SwitchBackFromStandby</i> message to initiate a switchback from a standby line card to the primary one. This message can only be sent if the action field of the message <i>SK_SwitchBackFromStandbyConfig</i> is set to 1 during configuration.
Sent by	Application or Converged Services Administrator (CSA).
Arguments	The following table shows the arguments that you can modify:

Argument	Description
Action	This field can be set to: <ul style="list-style-type: none"> 0 = graceful switchback after LLC determines that the standby card is not handling any calls. 1 = forced switchback immediately.
Node	Specifies the node where the switchback is supposed to happen.
StandbySlot	Specifies the standby slot of the redundant card.

C Structure

```
typedef struct {
    UBYTE StandbySlot;
    UBYTE Action;
} SK_SwitchBackFromStandby;
```

C Structure Response

```
typedef struct {
    int Status;
} SK_SwitchBackFromStandbyAck;
```

C++ Class

```
class SKC_SwitchBackFromStandby : public
    SKC_ToolkitMessage {
public:
    UBYTE getStandbySlot() const;
    void setStandbySlot(UBYTE x);
    UBYTE getAction() const;
    void setAction(UBYTE x);
};
```

C++ Class Response

```
class SKC_SwitchBackFromStandbyAck : public
    SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
```

SwitchBackFromStandby

};

SwitchMgrQuery

Type SwitchKit API message

Description Use the *SK_SwitchMgrQuery* to allow an application to find out the current configuration state of the SwitchManager. If the SwitchManager is in the process of configuring when an application connects to LLC, *SK_SwitchMgrQuery* will notify the application of this state.

If you have the application/LLC set to channel recovery method 2 or 3, where channels are taken out of service, it is the application's responsibility to take the channels back into service when the first application watching a specific channel group connects to LLC using *ForceGroupState*. Without *SK_SwitchMgrQuery*, when SwitchManager is being started while the application is also starting up, there may be a condition where the application will take channels inservice prior to the configuration being complete. This can cause critical configuration messages from SwitchManager to fail since the channel is already in-service.

Sent by Application or Converged Services Administrator (CSA).

Arguments The following table shows the arguments that you can modify:

Argument	Description
QueryType	This field can be set to: <ul style="list-style-type: none"> • 0 = SK_SMQ_CONFIG_STATUS • 0 = SK_SMQ_IDLE • 1 = SK_SMQ_CONFIGURING

C Structure

```
typedef struct {
    UBYTE QueryType;
    UBYTE reserved18[252];
} SK_SwitchMgrQuery;
```

C Structure Response

```

System Configuration 0x00AF

SwitchKit Name SystemConfig

Type EXS API and SwitchKit API message

Description **System Configuration 0x00AF**

This message configures system, non-related options.

Those options include:

- Message Resend Logic
- Host Link Failure Detection Logic
- System Busy Warning
- Resource Threshold

Sent by Host Application

Example Message (Socket Log Output for SwitchKit)

The following socket log output/example message shows the line card in slot 01 configured not to resend unacknowledged messages.

```
00 07 00 AF 00 00 FF 02 00
```

SwitchKit Code **Configuration**

```
SystemConfig (
    Node = integer,
    ConfigType = integer,
    Data = byte array);
```

NOTE: Data must contain the Slot AIB first:

```
0x00 0x01 0x01 0x01 SlotNumber
then the Data of the message as usual.
```

Example

This is an example of a SwitchManager message:

```
SystemConfig(Node=1, ConfigType=9,
    Data=0x00:0x01:0x01:0x01:0x05:
    0x01:0x04:0x00:0x01:0x02:0x03);
```

In this example, the slot number is: 0x00:0x01:0x01:0x01 in the slot AIB; and the data parameters of the message are: 0x01:0x04:0x00:0x01:0x02:0x03.

C Structure

```
typedef struct {
    UBYTE ConfigType;
```

```

    UBYTE Data[252];
} XL_SystemConfig;

```

C++ Class

```

class XLC_SystemConfig : public XLC_OutboundMessage {
public:
    UBYTE getConfigType() const;
    void setConfigType(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};

```

Overview of message The following table provides an overview of this message. The table following it provides the detail for each byte.

	AEs 0x01 Slot Must be included if Host Link Failure is for line cards.		
:	Data[0] (Data depends on the Configuration Type)		

: **0x02 Message Resend Logic**

Data[0] Options

- 0x00 Do Not Resend
Does not resend unacknowledged messages.
- 0x01 Resend Once (Default)*
- 0x02 Resend Once and Generate *Alarm* Message
- 0x03 Resend Until Acknowledged*
Resends the message until acknowledged by the host.
This applies to the following messages only: *Alarm*, *Alarm Cleared*,
Request For Service, *Request For Service with Data*, and
Channel Released.
- 0x04 Disable "Resend Until Acknowledged"
Do not resend the messages listed above until acknowledged by the
host. This cancels "Resend Until Acknowledged."

*To enable "Resend Until Acknowledged" you must also enable "Resend Once"

0x03 Host Link Failure Detection Logic

Data[0] Feature Enable/Disable

- 0x00 Disable Host Link Failure Detection (Default)
- 0x01 Enable Host Link Failure Detection

Data[1] Response to Host Link Failure (HLF)

Bit 0 Setting for whether spans and channels will be taken out-of-service
0 Set all channels out of service when host link failure detected (Default)
1 Set all spans and channels out of service when host link failure
detected

Bit 1 Setting for whether a response will be sent when an HLF is detected
0 A response will be sent
1 No response will be sent

Bit 2 Setting for taking SCCP/TCAP out-of-service
0 Do not take SCCP/TCAP out-of-service
1 Take SCCP/TCAP out-of-service

Data[2,3] Failure Detection Timer
Value expressed in 10 ms units

NOTE: The span/channels continue in the out-of-service state until the
host manually brings them back in-service.

0x06 System Busy Warning

Data[0] Sensitivity Level
0x00 Least Sensitive
0x01 :
0x02 :
0x03 :
0x04 :
0x05 Most Sensitive

Data[1] System Busy Warning

0x00 Disable (Default)
0x01 Enable

0x07 Resource Threshold

Data[0] Resource Type
0x01 Conferencing Timeslots

Data[1,2] Number of Assigned Timeslots to Generate an *Alarm Cleared* message
Data[3,4] Number of Assigned Timeslots to Generate an *Alarm* message

0x09 Resource Usage Reporting

Data[0] 0x00 Disable (Default)
0x01 Enable (Default interval is 5 minutes)
0x02 Change the Reporting Interval

Data[1] If Data[0] above is 0x00 (Disable) or 0x01 (Enable):
Number of Resources

If Data[0] above is 0x02 (Change the Reporting Interval):
Number of Minutes (Max: 254)

Data [2-N] Resource ID 1- Resource ID N:

NOTE: If Data[0] above is 0x02, Data[2-N] do not apply.

0x00 Memory
0x01 MCB
0x02 CPU Level 1
0x03 CPU Level 2

0x0B Approaching Busy Threshold for Slots

Data[0]

0x00 Disable

0x01 Enable

Default value are as follows:

Memory - 70 percent

MCB -70 percent

CPU - 80 percent.

0x02 Change Thresholds

Data[1] Number of Resources

Data[2-N] Resource ID 1- Resource ID N:

0x00 Memory (percentage, expressed in Hex)

0x01 MCB (percentage, expressed in Hex)

0x02 CPU Usage (percentage, expressed in Hex)

0x0C Real Busy Threshold for Slots

Data[0]

0x00 Disable Alarm (Default)

0x01 Enable Alarm

Default value are as follows:

Memory - 84 percent

MCB -84 percent

CPU - 90 percent.

Data[1] Number of Resources

Data[2-N] Resource ID 1- Resource ID N:

0x00 Memory (percentage, expressed in Hex)

0x01 MCB (percentage, expressed in Hex)

0x02 CPU Usage (percentage, expressed in Hex)

0x0D Message Grouping (Supported on ONE-series cards only)

Data[0]

- 0x00 Disable (Default)
- 0x01 Enable

0x11 DSP Resource Threshold Alarm

Data[0] DSP Function Type

- 0xFF Configure **all** DSP Function Types (except conferences) with the percentage values in Data[1] and Data[2] below

- 0x00 No Function Type

Tone Reception

- 0x01 DTMF μ -law (all DSP cards)

System Configuration Query 0x00B4

SwitchKit Name SystemConfigQuery

Type EXS API and SwitchKit API message

Description **System Configuration Query 0x00B4**

Use this message to query various configuration settings in the CSP. Some query results are reported in the response to the message, while others generate a *Generic Report* message.

NOTE: The acknowledgment for Active Conference IDs (query type 0x04) will return partial data — only the number of conferences. The report will have the remaining data, that is, all the conference IDs.

The data for the following Query Types is returned in the response:

- 0x02 - Message Resend Logic
- 0x03 - Host Link Failure Detection Logic
- 0x04 - Active Conference IDs
- 0x06 - System Busy Warning
- 0x17 - Extended Conference Enable

The data for the following Query Types is returned in the *Generic Report* message:

- 0x04 - Active Conference IDs
- 0x05 - Channel State
- 0x07 - Resource Threshold
- 0x09 - Resource Usage Reporting
- 0x0B - Approaching Busy Threshold for Slots
- 0x0C - Real Busy Threshold for Slots
- 0x10 - Detailed Conference Information
- 0x11 - DSP Resource Threshold
- 0x13 - Conference Speakers
- 0x14 - Conferencing Features
- 0x15 - Child Conference Information
- 0x16 - Child Conference IDs
- 0x18 - Cache File Query

For SwitchKit

To get this report, you must register for it by calling the `sk_msgRegister` function with the parameter, `SK_RESOURCE_UTIL_REPORT`.

Sent by Host Application

SwitchKit Code C Structure

```

System Resource Usage Query 0x008E

SwitchKit Name SystemResourceUtilQuery

Type EXS API and SwitchKit API message

Description **System Resource Usage Query 0x008E**

Use this message to query the utilization status of the following cards:
T-ONE, E-ONE, SS7 Series 3, SS7 PQ, DSP, and CSP Matrix Series 3 Card.

Sent by Host

Sample Message In the following sample, the host sends the System Resource Usage Query to the CSP to query the Resource Usage for a Card. Following is the response from the CSP.

Host-to-CSP

```
00 10 00 8e 00 00 ff 02 00 01 01 01 09 04 00 01 02 03
```

CSP-to-Host Response

T1 Span Configure 0x00A9

SwitchKit Name T1SpanConfig
Type EXS API and SwitchKit API message

Description **T1 Span Configure 0x00A9**
This message is used to configure the characteristics of a T1 span.

NOTE: Before changing span configuration, Dialogic ALWAYS RECOMMENDS that you de-assign the spans, assign them again and then send the new span configuration.

Sent by Host

Example Message (Socket Log Output for SwitchKit)

The following socket log output/example message shows a T1 Span being configured with D4 framing and a line coding method of bit 7 zero suppression. The line length is 0-133 feet.

```
00 0D 00 A9 00 00 FF 00 01 0C 02 01 23 09 06
```

SwitchKit Code **Configuration**

```
T1SpanConfig (  
    Node = integer,  
    Span = integer,  
    Format1 = integer,  
    Format2 = integer);
```

NOTE: In SwitchKit, the parameter Format1 is the same as Format in EXS API. In SwitchKit, the parameter Format2 is the same as Line Length in EXS API.

C Structure

```
typedef struct {  
    unsigned short Span;  
    UBYTE Format1;  
    UBYTE Format2;  
} XL_T1SpanConfig;
```

C++ Class

```
class XLC_T1SpanConfig : public XLC_SpanMessage {  
public:  
    unsigned short getSpan() const;  
    void setSpan(unsigned short x);  
    UBYTE getFormat1() const;  
    void setFormat1(UBYTE x);  
    UBYTE getFormat2() const;
```

```
void setFormat2(UBYTE x);
};
```

Tag Configuration 0x00D0

SwitchKit Name TagConfig

Type EXS API and SwitchKit API message

Description **Tag Configuration 0x00D0**

Each line card and CSP Matrix Series 3 Card card has battery-backed RAM that stores configuration information provided by the host. This message allows the host to assign a tag to a card's configuration. after it has been configured. If the card configuration is modified, due to either CSP restoration of default values or host-initiated configuration commands, the tag is reset to 0.

The tag is reported to the host in the *Card Status Report* and *Card Status Query* messages. With this feature, the host can quickly determine if a card has the proper configuration. When a card's configuration is modified, the tag is reset to 0, and the card must be retagged. In the event that the system is powered down, or a card is inserted, all battery-backed configuration is cleared.

Sent by Host

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE Slot;
    unsigned short BrdTag;
} XL_TagConfig;
```

C++ Class

```

	AEs		
	0x01 Slot		
:	Tag MSB, LSB A two-byte number assigned by the host to identify a card's configuration. NOTE: The Tag value 0x0000 is reserved for untagged configurations. The following is a list of the messages that would reset the configuration tag of a line card only if they are successfully processed (for example, the host receives a response Status of Positive Acknowledgment, 0x10).		

T-ONE, E-ONE, DS3

These messages reset the configuration tags of T-ONE, E-ONE, and DS3 cards:

- Answer Supervision Mode Configure
- Assign Logical Span ID
- B Channel Configure
- Busy Out Flag Configure
- D Channel Assign
- D Channel De-assign
- D Channel Facility List Configure
- DS3 Configure-Query (DS3 card only - when changing DS3 framer)
- Distant End Release Mode Configure
- E1 Span Configure
- Filter Timer Configure
- Flash Timing Configure
- Impulsing Parameter Configure
- Inseize Instruction List Configure
- Local End Release Mode Configure
- PCM Encoding Format Configure
- PPL Assign
- PPL Audit Configure
- PPL Configure
- PPL Timer Configure
- PPL Transmit Signal Configure
- Product License Download
- Receive Signaling Configure
- Service State Configure
- Span Filter Configure
- Start Dial Configure
- T1 Span Configure
- Transmit Signaling Configure
- Trunk Type Configure

J-ONE, SJ1LC

These messages reset the configuration tags of J-ONE cards:

- Assign Logical Span ID
- D Channel De-assign
- J1 Span Configure
- Service State Configure
- Span Filter Configure

DSP

These messages will reset the configuration tags DSP-ONE cards:

- Call Progress Analysis Class Configure
- Call Progress Analysis Pattern Configure
- DSP SIMM Configure
- Service State Configure
- Transmit Cadence Pattern Configure
- Transmit Tone Configure

Tag Configuration 0x00D0

TCAPMessageRegister

Type SwitchKit API message

Description Use the *SK_TCAPMessageRegister* message to register an application for all TCAP-related PPL Event Indications given a specific Originating Point Code (OPC)

Important! Only events of Component Type 0x70 (TCAP TUSI) will be sent to the registered application.

Sent by Function `sk_pplTCAPRegister()`

Arguments The following table shows the arguments you can change:

Argument	Description
int OPC	The Originating Point Code of the SS7 TCAP stack generating the PPL Event Indications.

C Structure

```
typedef struct {
    int OPC;
    UBYTE RegisterFlag;
} SK_TCAPMessageRegister;
```

C Structure Response

```
typedef struct {
    int Status;
} SK_TCAPMessageRegisterAck;
```

C++ Class

```
class SKC_TCAPMessageRegister : public
    SKC_ToolkitMessage {
public:
    int getOPC() const;
    void setOPC(int x);
    UBYTE getRegisterFlag() const;
    void setRegisterFlag(UBYTE x);
};
```

C++ Class Response

```
class SKC_TCAPMessageRegisterAck : public SKC_ToolkitAck
{
public:
    int getStatus() const;
    void setStatus(int x);
};
```

TFTP Manage 0x003A

SwitchKit Name	TFTPManage
Type	EXS API and SwitchKit API message
Description	<p>TFTP Manage 0x003A</p> <p>This message is used to download system software files and to query the TFTP configuration. You can send this message no matter what state the CSP Matrix Series 3 Card is in.</p> <p>To download CSP software, send the Begin Download ICB as well as appropriate Data ICB subtypes to send the following information to the CSP:</p> <ul style="list-style-type: none"> • Local Matrix Configuration Filename • Adjacent Matrix Configuration Filename • Local Matrix Server IP Address • Adjacent Matrix Server IP Address • Load Timestamp <p>Send the Begin Download ICB whenever you assign a new TFTP configuration file that contains information about a new load.</p> <p>To query the TFTP configuration, send one of the Action ICB query subtypes. The response to a query includes the corresponding Data ICB subtype.</p> <p>The Timestamp ICB is required only if the timestamp is not in the configuration file.</p> <p>Save Options, Load Version & Load Filename are CSP-initiated ICBs in response to the Query ICBs.</p> <p>Adjacent Matrix ICBs are needed only if you have an adjacent matrix, but they can also be sent directly to the adjacent matrix, instead of through the local matrix.</p>

Initiated by Host

SwitchKit Code **C Structure**

```
typedef struct {
    UBYTE ICBCount;
    UBYTE ICBDData[252];
} XL_TftpManage;
```

C Structure Response

```
typedef struct {
    unsigned short Status;
    UBYTE MoreStatus;
    UBYTE ICBCount;
    UBYTE ICBDData[249];
} XL_TftpManageAck;
```

C++ Class

```
class XLC_TftpManage : public XLC_OutboundMessage {
public:
    UBYTE getICBCount() const;
    void setICBCount(UBYTE x);
    const UBYTE *getICBData() const;
    UBYTE *getICBData();
    void setICBData(UBYTE *x);
};
```

C++ Class Response

```
class XLC_TftpManageAck : public XLC_AcknowledgeMessage {
public:
    unsigned short getStatus() const;
    void setStatus(unsigned short x);
    UBYTE getMoreStatus() const;
    void setMoreStatus(UBYTE x);
    UBYTE getICBCount() const;
    void setICBCount(UBYTE x);
    const UBYTE *getICBData() const;
    UBYTE *getICBData();
    void setICBData(UBYTE *x);
};
```

Configuring a Sample Pattern ID

The following example shows how to configure Pattern ID 0x17 to receive a three-second, 400 Hz tone. To perform this task, the host sends three API messages. First, the host sends the *Tone Configure* message to replace the default tone (Tone ID 0x0F, 425 Hz) with the new, 400 Hz tone. Second, the host sends the *CPA Pattern Configure* message to create the new Pattern ID 0x17. Third, the host sends the *CPA Class Configure* message to add Pattern 0x17 to the CPA class 0x00.

First Message: *Tone Configure*

Byte	Field Description
0	Message Frame 0xFE
1,2	Length (2 bytes) 0x0011
3,4	Message Type (2 bytes) 0x0031
5	Reserved 0x00
6	Sequence Number
7	Logical Node ID 0xFF
8	Update All Flag 0x01
9	Reserved 0x00
10	Tone Type 0x06

TransferChanMsg

Type SwitchKit API message

Description Use the *SK_TransferChanMsg* message when an application requires a different application to receive messages associated with a channel.

Span and channel describe the channel that is to be transferred to the target application. This channel must already be assigned to the current application. The Tag and Data fields are passed along without modification. The target application receives *SK_TransferChanMsg* with all the fields entered as they were entered by the sending application. The target application is then responsible for returning the channel to the LLC when it is finished with it.

Important! The span and channel must be specified in both the *TransferChanMsg* and the *TransferChanMsgAck* in order for the LLC to properly route this message to the appropriate applications. The channel is not physically transferred to the new application until the requesting application receives the Ack.

The application that receives the message must send a *SK_TransferChanMsgAck* to let the sending application know that the message was received. This can be done with the following code:

```
int handleTransfer(SK_Event *evt, void *tag){
    MsgStruct *msg = evt->IncomingMsg;
    SK_MSG_SWITCH(msg) {
        CASE_TransferChanMsg(tcm) {
            SK_TransferChanMsgAck a;
            sk_initMsg(&a, TAG_TransferChanMsgAck);
            a.Status = 0x10;
            sk_setSeqNum(&a, sk_getSeqNum(tcm));
            sk_sendMsgStruct((MsgStruct *)&a, NULL, NULL);
        };
    };
};
```

Sent by Application

C Structure

```
typedef struct {
    unsigned short Span;
    UBYTE Channel;
    int Target;
    unsigned short AckTimeout;
    int Tag1;
    int Tag2;
```

```

int Tag3;
int Tag4;
char AppGroupTarget[16];
unsigned short DataSize;
UBYTE Data[210];
} SK_TransferChanMsg;

```

C Structure Response

```

typedef struct {

void setData(UBYTE *x);
};
```

- SK_BAD_APP_NAME** Target application does not exist.
- SK_BAD_PARAMETER** Invalid parameter. This includes when the channel specified by span and channel is not allocated to the source application.
- SK_BAD_MESSAGE** LLC is unable to send the TransferCan Msg to the target application.

Transmit Cadence Pattern Configure 0x0030

SwitchKit Name TransmitCadencePatternConfig

Type EXS API and SwitchKit API message

Description **Transmit Cadence Pattern Configure 0x0030**

This message is used to allow the host to configure any transmit cadence pattern. The host can create the cadence and the duration of the tone needed. Each cycle block shown below represents two durations, either of which could be silence (Tone ID=0) or some valid Tone ID. These cycle blocks can be repeated or strung together with different cycle blocks. For tones which are to be continuously on the duration should be set to 0xFFFF.

Sent by Host

SwitchKit Code **Configuration**

```
TransmitCadencePatternConfig (
    Node = integer,
    UpdateFlag = integer,
    Action = integer,
    Data = byte array);
```

C Structure

```
typedef struct {
    UBYTE UpdateFlag;
    UBYTE Action;
    UBYTE Data[251];
} XL_TransmitCadencePatternConfig;
```

C++ Class

```
class XLC_TransmitCadencePatternConfig : public
    XLC_OutboundMessage {
public:
    UBYTE getUpdateFlag() const;
    void setUpdateFlag(UBYTE x);
    UBYTE getAction() const;
    void setAction(UBYTE x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

8	<p>Update All Flag A configuration is “engaged” when it is used when the tone is transmitted. 0x00Store configuration but do not engage it. This is the normal case for large configuration of parameters. Configuration will not be engaged until another message has this bit set to 1. 0x01Engage configuration immediately This is usually set for the last configuration message so configuration engaging takes place only once and for all of the new configuration previously sent.</p> <p>NOTE: A <i>Transmit Tone Query</i> message shows the configuration as updated even when the Update All flag is not set.</p>		

Transmit Cadence Pattern Configure 0x0030

9	Action 0x01Configure Pattern
10	<p>Data[0] The following data representation uniquely identifies a cadence pattern to be generated using the <i>Connect Tone Pattern</i> message. This message can be used for an existing pattern or a new one. The maximum number of cycle blocks in one pattern is three. The cycle block representation is a generic form in which all transmit cadence patterns could be created.</p> <p>Durations are expressed in 10 ms units.</p> <p>Data[0]Transmit Cadence Pattern ID Data[1]Number of Cycle Blocks Data[2]Block 1 Tone ID Data[3]Reserved Data[4]Block 1 On Duration, MSB Data[5]Block 1 On Duration, LSB Data[6]Block 1 Off Duration, MSB Data[7]Block 1 Off Duration, LSB Data[8]Number of times to execute this on and off cadence within this block, MSB Data[9]Number of times to execute this on and off cadence within this block, LSB : Data[n++]Block n Tone ID Data[n++]Reserved Data[n++]Block n On Duration, MSB Data[n++]Block n On Duration, LSB Data[n++]Block n Off Duration, MSB Data[n++]Block n Off Duration, LSB Data[n++]Number of times to execute this on and off cadence within this block, MSB Data[n++]Number of times to execute this on and off cadence within this block, LSB</p>
:	Checksum

Example

NOTE: To transmit the pattern continuously, do not set the “Number of times. . .” parameter in this message to 0xFFFF. Instead, set the appropriate parameter in the *Connect Tone Pattern* message. Please refer to the *Connect Tone Pattern* message for more information.

The following example shows the message contents that would be sent to configure a specific cadence pattern to be transmitted on any channel.

Durations are expressed in 10 ms units.

Configure Pattern: Pattern ID Number 2 (Ringback)

Cycle Block 1: Tone ID 4, 400 ms On/200 ms Off, execute once

Cycle Block 2: Tone ID 4, 400 ms On/3000 ms Off, execute once

Transmit Signaling Configure 0x0014

SwitchKit Name TransmitSignalingConfig

Type EXS API and SwitchKit API message

Description **Transmit Signaling Configure 0x0014**

This message is used to define the signaling transmitted by the CSP for non-standard trunk or line interfaces.

NOTE: Do not use this message without first contacting Dialogic Technical Support.

Sent by Host

SwitchKit Code **Configuration**

```
TransmitSignalingConfig (  
    Node = integer,  
    Range = StartSpan:StartChan - EndSpan:EndChan,  
    SignallingType = integer,  
    SignallingValue = integer,  
    TransmissionMode = integer);
```

C Structure

```
typedef struct {  
    unsigned short StartSpan;  
    UBYTE StartChannel;  
    unsigned short EndSpan;  
    UBYTE EndChannel;  
    UBYTE SignallingType;  
    UBYTE SignallingValue;  
    UBYTE TransmissionMode;  
} XL_TransmitSignalingConfig;
```

C++ Class

```
class XLC_TransmitSignalingConfig : public  
    XLC_ChanRangeMessage {  
public:  
    unsigned short getStartSpan() const;  
    void setStartSpan(unsigned short x);  
    UBYTE getStartChannel() const;  
    void setStartChannel(UBYTE x);  
    unsigned short getEndSpan() const;  
    void setEndSpan(unsigned short x);  
    UBYTE getEndChannel() const;  
    void setEndChannel(UBYTE x);  
    UBYTE getSignallingType() const;  
    void setSignallingType(UBYTE x);  
    UBYTE getSignallingValue() const;  
    void setSignallingValue(UBYTE x);  
    UBYTE getTransmissionMode() const;
```

```
void setTransmissionMode(UBYTE x);
};
```

Example—Invert E&M Wink Start Signaling

This example shows the message sequence sent to invert the default E&M Wink Start transmit signaling on a channel. The default E&M signaling values are: on-hook: A = 0, B = 0; all other signaling: A = 1, B = 1.

A separate message must be sent to change each signaling type.

Signaling Type	0x01 (On-hook)
Signaling Value	0x03 (A = 1, B = 1)
Transmission Mode	0x01 (A and B fixed)

Signaling Type	0x02 (Initial Outseize)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)

Signaling Type	0x03 (Secondary Outseize)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)

Signaling Type	0x04 (Inseize Acknowledgment)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)

Signaling Type	0x05 (Answer)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)

Signaling Type	0x06 (Post Outseize Acknowledgment)
Signaling Value	0x00 (A = 0, B = 0)
Transmission Mode	0x01 (A and B fixed)

Trunk Type Configure 0x0011

SwitchKit Name TrunkTypeConfig

Type EXS API and SwitchKit API message

Description **Trunk Type Configure 0x0011**

The message is required only for the T-ONE card. It sets the trunk or line interface protocol for a channel or group of channels. Logical Span IDs must be assigned to channels before this message can be sent.

This should be the first message sent when configuring channels, as any configuration sent before it resets to the defaults for the trunk type specified.

Trunk types define the standard signaling protocol used by a channel or group of channels. The *Trunk Type Configure* message sets all of the channel configuration to the defaults associated with the trunk type (based on the AT&T publication 43801 and the Bellcore TR-TSY-000506 specifications).

The default trunk type is E&M for T1 spans, and PPL (ITU-T Compelled R2) for E1 spans. Trunk types may be different for each individual channel on a span. This allows applications that require mixed trunk types to reside on the same span.

Configuration associated with each trunk type include the start dial type, signal scanning filters and timers, and transmit signal timers. Any configuration which varies from the defaults must be reissued following the sending of a *Trunk Type Configure* message.

NOTE: This message cannot be used for channels on a T-ONE or E-ONE line card with the span format set to Clear Channel. If so, a NACK of 0x17 (Invalid Data Type) is returned.

Sent by Host

SwitchKit Code **Configuration**

```
TrunkTypeConfig (
    Node = integer,
    Range = StartSpan:StartChan - EndSpan:EndChan,
    TrunkType = integer);
```

C Structure

```
typedef struct {
    unsigned short StartSpan;
    UBYTE StartChannel;
    unsigned short EndSpan;
    UBYTE EndChannel;
    UBYTE TrunkType;
} XL_TrunkTypeConfig;
```

C++ Class

```
class XLC_TrunkTypeConfig : public XLC_ChanRangeMessage {
public:
    unsigned short getStartSpan() const;
    void setStartSpan(unsigned short x);
    UBYTE getStartChannel() const;
    void setStartChannel(UBYTE x);
    unsigned short getEndSpan() const;
    void setEndSpan(unsigned short x);
    UBYTE getEndChannel() const;
    void setEndChannel(UBYTE x);
    UBYTE getTrunkType() const;
    void setTrunkType(UBYTE x);
};
```

UpgradeSoftwarePatch

TypeType	SwitchKit API message
Description	Use the <i>SK_UpgradeSoftwarePatch</i> message to upgrade node software specified by the functions setNode (UBYTE n) and getNode () of the base class <i>SKC_Message</i> .
Sent by	SwitchManager
Arguments	The following table shows the arguments that you can modify:

Argument	Description
Filename	File name of software patch to be downloaded.

C Structure	<pre>typedef struct { char Filename[230]; } SK_UpgradeSoftwarePatch;</pre>
C Structure Response	<pre>typedef struct { int Status; } SK_UpgradeSoftwarePatchAck;</pre>
C++ Class	<pre>class SKC_UpgradeSoftwarePatch : public SKC_ToolkitMessage { public: const char *getFilename() const; void setFilename(const char *x); };</pre>
C++ Class Response	<pre>class SKC_UpgradeSoftwarePatchAck : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); };</pre>

UserTimer

Type SwitchKit API message

Purpose Use the *SK_UserTimer* message to cause an event to arrive at a predetermined time. The message that arrives at timer expiration is a *SK_UserTimerAck*.

Description The timer is tracked in the lower layers of the API, not by the LLC. It uses the socket-select mechanism for determining when the timer has expired which allows the timers to be operating system-independent, efficient, and relatively accurate. Without a real-time operating system, there is no guarantee of timing.

There are no data fields in a *SK_UserTimer* message because, when sent with a tag through an appropriate toolkit sending function, a tag will also be associated with the acknowledgment that arrives after the time period has elapsed.

Sent by Application

How to Set Up a Timer in C In C, a variable of *SK_UserTimer* must be declared. The message must be initialized using *sk_initMsg()*. Then, the arguments must be initialized. Any of the SwitchKit send routines may be used to send the message and assign a message handler to handle the acknowledgement when the timer expires.

```
{
...
    SK_UserTimer userTimer;
    sk_initMsg(&userTimer, TAG_UserTimer);
    userTimer.Seconds = 5;
    // Number of seconds until timer expires.
    userTimer.GroupTag = 3;
    // Used to identify timer upon cancellation
    sk_sendMsgStruct((MsgStruct *)&userTimer, (void
    *)myData, timerExpiredHandler);
...
};
```

How to Set Up a Timer in C++

In C++, a object of class *SKC_UserTimer* is created. Then, the arguments must be initialized using the `setSeconds()` and `setGroupTag()` methods of the class. The `send` method, which is a member of a base class inherited by *SKC_UserTimer*, can be used to send the message.

```
{
...
    SKC_UserTimer userTimer;
    userTimer.setSeconds(5);
    // Number of seconds until timer expires
    userTimer.setGroupTag(3);
    // Used to identify timer upon cancellation
    userTimer.send((void *)myData, timerExpiredHandler);
...
};
```

Arguments

The following table shows the arguments you can change for *UserTimer*:

Argument	Description
Seconds	The delta time in seconds from when the <i>UserTimer</i> message is sent to when the <i>UserTimerAck</i> will be sent to indicate expiration of the timer.
GroupTag	Cancellation of a timer requires that GroupTag be set at creation of the timer. When you want to cancel a <i>UserTimer</i> , you need to send a <i>CancelUserTimer</i> message with the appropriate GroupTag. All currently unexpired UserTimer messages from that application with the corresponding GroupTag are canceled. It is important to realize that the GroupTag domain is unique to each application. This prevents one application from canceling another application's <i>UserTimer</i> . If multiple applications use the same GroupTag in a timer, and one application cancels that tag, only the timers from that application will be canceled. All other timers will still expire normally.

Return Status

The following table shows the possible return states:

Value	Description
SK_SUCCESS	Success
SK_CANCELED	Timer is cancelled (verify this)

C Structure

```
typedef struct {
    float Seconds;
    int GroupTag;
} SK_UserTimer;
```

C Structure Response

```
typedef struct {
    int Status;
} SK_UserTimerAck;
```

C++ Class

```
class SKC_UserTimer : public SKC_ToolkitMessage {
public:
    float getSeconds() const;
    void setSeconds(float x);
    int getGroupTag() const;
    void setGroupTag(int x);
};
```

C++ Class Response

```
class SKC_UserTimerAck : public SKC_ToolkitAck {
public:
    int getStatus() const;
    void setStatus(int x);
};
```

Response Status Indications

The following response status indications are available for the V5 Configure message:

0x01 Invalid V5 Interface ID

Internal slot initialization error for the V5 ID, or the host may be trying to:

- assign a V5 interface ID when this ID is already assigned in the CSP for the given network side (AN or LE).
- create a V5 ID that is greater than the maximum allowed.
- destroy a V5 ID that is greater than the maximum allowed.
- add a C Channel to a V5 ID that is not configured in the system.
- add a C Channel to a V5 ID that is greater than the maximum allowed.
- create a V5 ID that already exists.

0x02 Invalid TLV Length

One or more TLVs used in this message have an incorrect length.

0x03 Unrecognized TLV Tag

Unrecognized internal IMSG TLV tag was retrieved from IMSG.

0x04 Invalid V5 Variant ID

A null pointer was encountered while attempting to configure the V5 variant ID for a V5 ID.

0x05 Invalid V5 Variant Type

A null pointer was encountered while attempting to configure the V5 variant type.

0x06 Invalid Configuration Value

- The host may be attempting to configure the network side as AN or LE and has passed an invalid value for the network side.
- A null pointer was configured while attempting to configure the network side.
- The host may have sent an invalid value for the Configure Type.

0x07 Invalid User Port ID Range

- The host may be attempting to add a user port range when there were not enough free user port entries in the configuration database to accommodate the range.
- The host may be attempting to add a user port range when a user port ID within the desired range was already configured.
- The host may be attempting to add or remove a user port range that was invalid. The low range must be less than or equal to the high range and the total range must be less than or equal to the maximum allowed for each card.

See next RSV (0x08) for more information.

0x08 Invalid Tag ID

- The host may be attempting to add or remove a user port ID that is greater than the maximum allowed.
- The host may be attempting to add or remove a user port range that contained an incorrect user port type field.
- The host may be attempting to add or remove more ranges than are allowed (50).
- The host may have encountered a null pointer when attempting to add or remove user ports.

0x09 V5 Interface is In Service

The host may be attempting to add or remove a C Channel for an interface that was in service.

0x0A Invalid C Channel

- The host may be attempting to add or remove a C Channel that was greater than the maximum allowed per interface.
- The host may be attempting to add a C Channel to a timeslot that was already being used.
- The host may be attempting to add a C Channel with an invalid C Channel type value.
- The host may be attempting to add a C Channel to an interface that already has this logical C Channel assigned to it.
- The host was attempting to remove a C channel with an invalid C Channel ID.

0x0B Invalid Link ID

The host may be trying to:

- add a link with a span ID that is already assigned to another V5 interface.
- add a link when the link ID is already assigned to this V5 ID.
- add or remove a link ID that is greater than the maximum allowed.
- add a C Channel with a link ID that is not configured.
- remove a link that has a C Channel on it.
- add a link containing a C Channel to an interface that is in service.
- add a C Channel with a span ID that does not belong to the corresponding link ID.
- add a C Channel with a link ID that is greater than the maximum allowed.
- remove a link that is not configured.

0x0C Duplicate User Port Assignment Attempt

- The host may be attempting to add a duplicate user port ID to a V5 ID for a different Timeslot for V5.1.
- A null pointer was encountered

		13	System Software Minor Revision
		14	System Software Build Number
		15-18	CSP Matrix Series 3 Card Timestamp (4 Bytes)
		19-22	Adjacent CSP Matrix Series 3 Card Timestamp (4 Bytes)
		23	Checksum

Notes:

1. If System Software Major Rev, System Software Minor Rev, and System Software build Number fields are "0," system software is not present.
2. When in the process of downloading, the system software versions reflect the version of the code being downloaded. The version of the code which is being executed by the CSP may differ during download.
3. It is recommended that the host rely on the *Poll* message to determine when system software must be downloaded.
4. If a second CSP Matrix Series 3 Card is not installed, or if the system software is not present on the second CSP Matrix Series 3 Card, the *Adjacent Matrix Controller Timestamp* field will show "0."
5. Timestamp equals number of seconds since January 1, 1970.

Virtual Card Configure 0x00E0

SwitchKit Name	VirtualSlotConfig
Type	EXS API and SwitchKit API message
Description	<p>Virtual Card Configure 0x00E0</p> <p>Use this message when configuring virtual spans to simulate the adding and removing of cards that do not exist in the system. The slot numbers you configure with this message are used when configuring the virtual spans. You must send this message prior to the <i>Assign Logical Span ID</i> message.</p> <p>NOTE: De-assigning all spans using the <i>Assign Logical Span ID</i> (0x00A8) message will clean up all virtual slots which acts as if the virtual cards were removed.</p>
Related Messages	Virtual Span Configure
Sent by	Host
Example Message	<p>The following example configures virtual slot 40 on board type 80, virtual VDAC card.</p> <pre>00 0d 00 E0 00 00 ff 00 00 01 01 01 02 40 80</pre>
SwitchKit Code	<p>Configuration</p> <pre>VirtualSlotConfig (Node = integer, ConfigType = integer, Data = byte array);</pre> <p>C Structure</p> <pre>typedef struct { BaseFields Base; UBYTE ConfigType; UBYTE Data[222]; } XL_VirtualSlotConfig;</pre> <p>C++ Class</p> <pre>class XLC_VirtualSlotConfig : public XLC_OutboundMessage { public: UBYTE getConfigType() const; void setConfigType(UBYTE x); const UBYTE *getData() const; UBYTE *getData(); void setData(UBYTE *x); };</pre>

Virtual Span Control 0x00E2

SwitchKit Name	VirtualSpanControl
Type	EXS API and SwitchKit API message
Description	<p>Virtual Span Control 0x00E2</p> <p>This message is used by the host to indicate to the CSP the Layer 1 state of a Virtual Span.</p>
Sent	Host
Example Message	<p>The following example brings all virtual spans in the node into service.</p> <p>00 0E 00 E2 00 00 FF 00 01 0C 02 00 00 00 01 00</p>

SwitchKit Code Configuration

```
VirtualSpanControl (
    Node = integer,
    Span = integer,
    Event = integer,
    Data = byte array);
```

C Structure

```
typedef struct {
    unsigned short Span;
    UBYTE reserved19[28];
    unsigned short Event;
    UBYTE Data[221];
} XL_VirtualSpanControl;
```

C++ Class

```
class XLC_VirtualSpanControl : public XLC_SpanMessage {
public:
    unsigned short getSpan() const;
    void setSpan(unsigned short x);
    unsigned short getEvent() const;
    void setEvent(unsigned short x);
    const UBYTE *getData() const;
    UBYTE *getData();
    void setData(UBYTE *x);
};
```

VoIP Protocol Configure 0x00EE

SwitchKit Name VOIPProtocolConfig

Type EXS API and SwitchKit API message

Description **VoIP Protocol Configure 0x00EE**

This message is used to configure H.323 and Session Initiation Protocol (SIP) software.

Sent by Host

Example Message (Socket Log Output for SwitchKit)

The following socket log output/example message shows local SIP registrations enabled:

```
00 0E 00 EE 00 00 FF 00 00 00 00 01 01 C8 01 04
```

Overview of message

The following table provides an overview of this message. The table following it, provides the detail for each byte.

MESSAGE (White)		RESPONSE (Gray)

WatchChanGroup

Type	SwitchKit API message
Description	This message is used if your application sends the sk_watchChannelGroup() function.
Sent by	Function sk_watchChannelGroup() ;
C Structure	<pre>typedef struct { } SK_WatchChanGroup;</pre>
C++ Class	<pre>class SKC_WatchChanGroup : public SKC_AdminMessage { public: };</pre>

WriteCfgFile

Type	SwitchKit API message
Purpose	Use the <i>SK_WriteCfgFile</i> message to instruct SwitchManager to write the configuration file.
Description	When this message is received by SwitchManager, it will search through its database of messages for each slot on each node. Each message will be written to the new file.
Sent by	Application
Arguments	The following table shows the user modifiable arguments:

Argument	Description
Filename	The name of the file to write to. If blank (e.g. ""), then SwitchManager will write to a filename derived from the input file. For example, if the original file is myConfig.cfg and no filename is provided to <i>SK_WriteCfg</i> , the first time <i>SK_WriteCfg</i> is called, the output name will be myConfig_1.cfg.

C Structure	<pre>typedef struct { char Filename[230]; } <i>SK_WriteCfgFile</i>;</pre>
C Structure Response	<pre>typedef struct { int Status; } <i>SK_WriteCfgFileAck</i>;</pre>
C++ Class	<pre>class <i>SKC_WriteCfgFile</i> : public SKC_ToolkitMessage { public: const char *getFilename() const; void setFilename(const char *x); };</pre>
C++ Class Response	<pre>class <i>SKC_WriteCfgFileAck</i> : public SKC_ToolkitAck { public: int getStatus() const; void setStatus(int x); const UBYTE *getReserved() const; UBYTE *getReserved(); void setReserved(UBYTE *x); };</pre>

2 Address Elements

Overview

Purpose This chapter lists the Address Elements (AEs) used in the EXS API. The single-byte (0xNN) AEs are first, listed in hexadecimal numerical order. They are followed by the double-byte (0xNNNN) AEs, also listed in hexadecimal numerical order.

Introduction to Address Elements and Address Information Blocks

Generic AIB Format An Address Information Block (AIB) is used to address system objects, such as spans and channels. An AIB has a header, followed by one or more Address Elements. An Address Element is a group of data bytes that represent specific address information.

AIB Field Description
Address Method
Number of Address Elements
Address Element Type
Data Length (n)
Data[0]
:
Data[n-1]

Address Method

Use this field to specify one of two methods for the AIB:

Individual or Range

0x00 - Individual AEs

The Individual AEs method treats each Address Element as a single entity. Use the Individual AEs method to address the following:

- A single component, such as a channel or a slot
- Multiple independent components that are not in a range, such as two channels in a *Connect* message, where Address Element 1 defines Channel A and Address Element 2 defines Channel B.

0x01 - Range

Use this method to define the two Address Elements that are the starting and ending entities in a range.

For example, you use this method in an *Impulsing Parameters Configure* message to configure a range of channels, where Address Element 1 defines the starting channel and Address Element 2 defines the ending channel.

Important! The field is contained in the AIB in the API messages not in the AE tables in this chapter.

Number of Address Elements

This field indicates the number of Address Elements in the AIB.

An Address Element is a group of data bytes that describe an address. The number of data bytes in an Address Element varies, depending on the address element type.

Important! The field is contained in the AIB in the API messages not in the AE tables in this chapter.

Address Element (AE) Type

This field specifies the Address Element (AE) type. An AIB can contain several AEs. PPL Components use Address Elements in various PPL Messages.

If you use the *Individual AEs* Addressing Method, you can insert multiple AEs, of different types, into a single AIB.

If you use the *Range* Addressing Method, you can insert two, and only two, Address Elements, and they must both be of the same Address Type.

Data Length

This field indicates the number of data bytes in the AE immediately following this byte. If an AE contains no data, the value of this field is 0x00.

Data[0] . . . Data[n]

The number of Address Elements in an AIB depends on the message, address type, and addressing requirements.

For example, the table below shows an AIB that has one Address Element, which in turn contains two data fields.

Byte	AE Field Description
2	Address Element Type (0x12)
3	Data Length (0x02)
4	Data[0] – Slot Number
5	Data[1] – SIMM Number

Using AIBs

To use AIBs in a message, perform the following steps:

1. Determine the required address method and address type. Each message shows the AIBs that are supported by that message. The AIBs are presented in tables similar to the one above. Remember to build flexibility into your applications to allow for future expansion of the API, including new AIB Address Methods and Types, new addressing requirements, and new functionality.
2. Insert the information, as defined in the table, into the AIB section of the message. The addressing requirements of the message determine the values for the *Address Method* and *Number of Address Elements* fields. The object being addressed determines the address data fields.

The table below shows how an AIB is inserted into an API message. The address data fields are bytes 12–13.

MESSAGE	
Byte	Field Description
0	Frame Character (0xFE)
1	Length, MSB (0x00)
2	Length, LSB (0x0D)
3	Message Type, MSB
4	Message Type, LSB
5	Reserved (0x00)
6	Sequence Number
7	Node ID
8	AIB ..
9	
10	
11	
12	
13	
14	Checksum

Address Method
Number of Address Elements
Address Element Type
Data Length (0x04)
Data[0] – Slot Number
Data[1] – SIMM Number

Example 1

The table below shows the *ARP Cache Query* message, with an AIB inside it. You would refer to the Slot AE for its format.

MESSAGE (White)	
Byte	Field Description
0	Frame (0xFE)
1, 2	Length (0xNNNN)
3, 4	Message Type (0x00FC)
5	Reserved (0x00)
6	Sequence Number
7	Logical Node ID
:	AIB
	Address Method 0x00 - Individual AEs
	Number of AEs to follow
	AE 0x01 Slot
:	Data Type (0x00: TLVs)
:	Number of TLVs to follow
:	Data (TLVs) 0x01DC VoIP Module 0x01DD Flush ARP Cache Table Entry
:	Checksum

Example 2 - Individual AEs Method – Two Address Elements

The table below shows an AIB that uses the Individual AEs address method and that has two Address Elements. This AIB would be used in the *Connect* message, where:

- Address Element 1 defines Channel A
- Address Element 2 defines Channel B

MESSAGE (White)	
Byte	Field Description
0	Frame (0xFE)
1, 2	Length (0x0011)
3, 4	Message Type (0x0000)
5	Reserved (0x00)
6	Sequence Number
7	Logical Node ID

:	<u>AIB</u> Address Method 0x00 - Individual
	Number of AEs to follow 0x02
	AEs 0x0D Channel A 0x0D Channel B
:	Checksum

Example 2 - Range Method

The table below shows an example of an AIB that uses the Range address method. This AIB would be used in configuration messages to address a range of channels or other components, where:

- Address Element 1 defines the Starting Channel
- Address Element 2 defines the Ending Channel.

A range must contain **two and only two** Address Elements.

Important! To address a single channel using the range method, enter the same channel as both the starting and ending channel.

MESSAGE (White)	
Byte	Field Description
0	Frame (0xFE)
1, 2	Length (0xNNNN)
3, 4	Message Type (0x00D3)

* Some API messages such as the *Line Card Switchover* message require two AEs as follows:

Byte	AIB Field Description
2	Address Element: 0x01
3	Data Length 0x01
4	Data[0] Starting Slot Number

Byte	AIB Field Description
5	Address Element 0x01
6	Data Length 0x01
7	Data[0] Ending Slot Number

Slot Numbering

The tables below show the slot numbering schemes for the front and back of the CSP chassis.

Front Slot Numbering, CSP

Front Slots	Power Cards	Line Cards								Matrix Cards	Fan Tray
Chassis Label	Power2	15	14	13	12	11	10	9	8	CPU2	0x16
Software (Hex)	0x11	0x0F	0x0E	0x0D	0x0C	0x0B	0x0A	0x09	0x08	0x21	0x10
Chassis Label	Power1	7	6	5	4	3	2	1	0	CPU1	
Software (Hex)	0x12	0x07	0x06	0x05	0x04	0x03	0x02	0x01	0x00	0x20	

Back Slot Numbering, CSP

Back Slots	Matrix I/Os	Redundant or Standby Line Card I/Os							
Chassis Label	CPU1	0	1	2	3	4	5	6	7
Software (Hex)	0x14	0x30	0x31	0x32	0x33	0x34	0x35	0x36	0x37
Chassis Label	CPU2	8	9	10	11	12	13	14	15
Software (Hex)	0x15	0x38	0x39	0x3A	0x3B	0x3C	0x3D	0x3E	0x3F

0x06 ISDN Call Reference

Byte	AIB Field Description
2	Address Element: 0x06
3	Data Length: 0x04
4	Data[0] Slot Number
5	Data[1] Profile
6	Data[2] Subrate
7	Data[3] Call Reference

0x08 SS7 Stack

Byte	AIB Field Description
2	Address Element: 0x08
3	Data Length: 0x01
4	Data[0] Stack ID

0x09 SS7 Link

To address an SS7 signaling link, use the SS7 Link Address Element:

Byte	AIB Field Description
2	Address Element: 0x09
3	Data Length: 0x02
4	Data[0] Stack ID
5	Data[1] Link ID

0x0C Logical Span

Byte	AIB Field Description	
2	Address Element:	0x0C
3	Data Length:	0x02
4, 5	Data[0, 1]	Logical Span ID (MSB, LSB)

0x0D Channel

Byte	AIB Field Description	
2	Address Element:	0x0D
3	Data Length	0x03
4, 5	Data[0, 1]	Logical Span ID (MSB, LSB)
6	Data[2]	Channel

0x0E EXS Host-Slave Node

Byte	AIB Field Description	
2	Address Element	0x0E
3	Data Length	0x01
4	Data[0]	Logical Node ID (Host Node: 0x000 - 0x1F)
5	Address Element	0x0E
6	Data Length	0x01
7	Data[0]	Logical Node ID (Slave Node: 0x000 - 0x1F)

0x10 Logical/Physical Node

Byte	AIB Field Description
2	Address Element 0x10
3	Data Length: 0x05
4-7	<p>Data[0-3] Physical Node ID (4 Bytes)</p> <p>Enter the hexadecimal value of the last four digits of the serial number on the chassis or EXNET-ONE card. For the CSP 2090 and CSP 2040, you can find the last four digits on the rear of the CSP.</p> <p>EXNET Connect® Because EXNET Connect® is a card within a PC chassis, you assign the physical node ID by:</p> <p>Using the serial number of the EXNET Connect® card for the last four digits of the serial number.</p> <p>Set the two most significant bytes to 0x0001.</p> <p>If the serial number of the user's EXNET Connect® card was 0x03AD, in the Assign Logical Node ID message (0x10) define the value of the Physical Node ID field as 0x000103AD.</p>
8	<p>Data[4] Logical Node ID</p> <p>Enter the ID you are assigning to the node. The default logical node ID of any CSP is 0xFF.</p> <p>When you use message 0x0010 to assign a logical node ID to a node, you must use the value 0xFF in the Logical Node ID field in the message header. The new logical ID is the value of Byte 8 in the AIB.</p> <p>To reassign a logical node ID, you must bring the EXNET® ring out of service.</p>

0x11 Logical/Physical Span

Byte	AIB Field Description
2	Address Element 0x11
3	Data Length 0x04

Byte	AIB Field Description	
4,5	Data[0, 1]	Logical Span ID (MSB, LSB) Single-node system: 0-83 (0x0000-0x0053) Multi-node system: 0-1343 (0x0000-0x0053F) NOTE: When configuring a node for greater than 64 spans, please contact Dialogic Technical Support for assistance. The value 0xFFFF is reserved for de-assigning span IDs.
6	Data[2]	Slot For the CSP 2090: 0-15 For the CSP 2040: 0-3
7	Data[3]	Physical Span/Offset 4-Span Line Card: 0-3 8-Span Line Card: 0-7 16-Span Line Card: 0-15 DS3 Card: 0-27 VDAC-ONE Card 0-4 IPN Series 2 Profile 1 0-31 Profile 2 0-15

0x12 DSP SIMM

Byte	AIB Field Description	
2	Address Element 0x12	
3	Data Length	0x02
4	Data[0]	Slot Number (0x00-0x0F)
5	Data[1]	SIMM Number (0x00-0x03)

0x13 Physical Span

Byte	AIB Field Description	
2	Address Element 0x13	
3	Data Length	0x02
4	Data[0]	Slot Number (0x00-0x0F)
5	Data[1]	Physical Span
		NOTE: When you use this AIB for Loop Timing on the EXNET-ONE or EXNET Connect® card, this field represents the span offset number of the span to be the loop timing source. To derive timing from the EXNET® ring, the Physical Span Number is not used.

0x14 SS7 CIC Group

In this AIB, the fields define a CIC Group by assigning a span/channel as the Base CIC for the group, and by defining the number of channels in the group. The remaining channels in the group are assigned CIC numbers in sequence. All the CICs in a group must be on the same span.

Byte	AIB Field Description	
2	Address Element:	0x14
3	Data Length:	0x07
4	Data[0]	Stack ID
5, 6	Data[1, 2]	Base CIC Number (MSB, LSB) A number assigned by the host to the base CIC for the group of circuits (2 bytes).
7, 8	Data[3, 4]	Base CIC Span (MSB, LSB) Logical Span ID on which the channel to be assigned as the base CIC for the group is located. .
9	Data[5]	Base CIC Channel Channel to be assigned as the base CIC for the group (0x00–0x1F).
10	Data[6]	Number of CICs in Group The number of channels being assigned in the group (0x00–0x1F).

0x15 ISDN Primary D Channel

Byte	AIB Field Description
2	Address Element: 0x15
3	Data Length: 0x04
4	Data[0] Slot Number
5, 6	Data[1, 2] Logical Span ID (MSB, LSB)
7	Data[3] Channel

0x16 ISDN Secondary D Channel

Byte	AIB Field Description
2	Address Element: 0x16
3	Data Length: 0x07
4	Data[0] Slot Number
5, 6	Data[1, 2] Primary Logical Span ID (MSB, LSB)
7	Data[3] Primary D Channel
8,9	Data[4, 5] Secondary Logical Span ID (MSB, LSB)
10	Data[6] Secondary D Channel

0x17 Subrate

Byte	AIB Field Description
2	Address Element: 0x17
3	Data Length: 0x04
4, 5	Data[0, 1] Logical Span ID (MSB, LSB)
6	Data[2] Channel
7	Data[3] Subrate ID 0x00 Bits 6,7 (16Kbs, 4:1 TDM Mode) 0x01 Bits 5,4 (16Kbs, 4:1 TDM Mode) 0x02 Bits 3,2 (16Kbs, 4:1 TDM Mode) 0x03 Bits 1,0 (16Kbs, 4:1 TDM Mode)

0x1A EXNET Ring

To address a logical ring ID, use the EXNET Ring Address Element

Byte	AIB Field Description
2	Address Element: 0x1A
3	Data Length: 0x01
4	Data[0] Logical Ring ID

0x1C SS7 Destination ID

Byte	AIB Field Description	
2	Address Element: 0x1C	
3	Data Length:	0x03
4	Data[0]	Stack ID
5, 6	Data[1, 2]	Destination ID

0x1D SS7 Route

Byte	AIB Field Description	
2	Address Element: 0x1D	
3	Data Length:	0x03
4	Data[0]	Stack ID
5, 6	Data[1, 2]	Route ID

0x1E SS7 Link Set

Byte	AIB Field Description	
2	Address Element: 0x1E	
3	Data Length:	0x02
4	Data[0]	Stack ID Stack assigned by the host 0x00 - 0x03
5	Data[1]	Link Set ID The signaling link set to assign this link to: 0x00–0x23 Signaling Link Sets 0–35 0xFF Deconfigure the specified signaling link

0x1F SS7 Link Set/Link

Byte	AIB Field Description	
2	Address Element: 0x1F	
3	Data Length:	0x03
4	Data[0]	Stack ID (0-3)
5	Data[1]	Link Set ID Indicates the signaling link set to which this link is being assigned. 0x00-0x23 Signaling Link Sets 0-35
6	Data[2]	Link ID 0x00-0x0F - Primary SS7 Card 0x10-0x1F - Secondary SS7 Card

0x20 SS7 Destination/Route

Byte	AIB Field Description	
2	Address Element: 0x20	
3	Data Length:	0x05
4	Data[0]	Stack ID
5, 6	Data[1, 2]	Destination ID 0x0000 - 0x007F
7, 8	Data[3, 4]	Route ID 0x0000 - 0x01FF

0x21 SS7 Slot

Byte	AIB Field Description	
2	Address Element: 0x21	
3	Data Length:	0x02
4	Data[0]	Slot Number
5	Data[1]	Stack ID

0x22 DSP Chip

This AIB is used in the *DSP SIMM Configure* (0x00C0) message and *Service State Configure* message to specify an individual DSP chip.

Byte	AIB Field Description	
2	Address Element: 0x22	
3	Data Length:	0x03
4	Data[0]	Slot Number
5	Data[1]	SIMM Number: 0x00 Module 0 0x01 Module 1 0xFF (all DSP chips on all Modules)
6	Data[2]	DSP Chip Number: 0x00 DSP 0 0x01 DSP 1 0x02 DSP 2 0x03 DSP 3 0xFF (all DSPs on this Module)

0x23 Slot/Subrate

Byte	AIB Field Description	
2	Address Element:	0x23
3	Data Length:	0x05
4	Data[0]	Slot Number
5, 6	Data[1, 2]	Logical Span ID (MSB, LSB)
7	Data[3]	Channel
8	Data[4]	Subrate ID 0x00 Bits 6,7 (16Kbs, 4:1 TDM Mode) 0x01 Bits 5,4 (16Kbs, 4:1 TDM Mode) 0x02 Bits 3,2 (16Kbs, 4:1 TDM Mode) 0x03 Bits 1,0 (16Kbs, 4:1 TDM Mode)

0x25 Subrate Channel

Byte	AIB Field Description	
2	Address Method	0x00 (Individual AEs)
3	Number of AEs	0x01
4	Address Element	0x25
5	Data Length	0x05
6, 7	Data[0, 1]	Logical Span ID (MSB, LSB)
8, 9	Data[2, 3]	Subrate Channel
10	Data[4]	Number of bits in Subrate Channel

0x27 ISDN BRI TEI

Byte	AIB Field Description	
2	Address Element:	0x27
3	Data Length:	0x07
4, 5	Data[0, 1]	Logical Span ID (MSB, LSB)
6	Data[2]	Channel
7	Data[3]	Subrate ID 0x00 Bits 6,7 (16Kbs, 4:1 TDM Mode) 0x01 Bits 5,4 (16Kbs, 4:1 TDM Mode) 0x02 Bits 3,2 (16Kbs, 4:1 TDM Mode) 0x03 Bits 1,0 (16Kbs, 4:1 TDM Mode)
8	Data[4]	SAPI
9	Data[5]	CES
10	Data[6]	TEI

0x29 Router

In the *Route Control* message, to use the internal router to find a destination channel, use the Router address type. Currently, the Router Handle is always 0xFFFE.

Byte	AIB Field Description	
2	Address Element:	0x29
3	Data Length:	0x02
4, 5	Data[0, 1]	Router Handle

0x2A SS7 Subsystem Number

Byte	AIB Field Description	
2	Address Element:	0x2A
3	Data Length:	0x03
4	Data[0]	Stack ID
5	Data[1]	SCCP Subsystem Number
6	Data[2]	0x00 (Reserved)

0x2C V5 ID

If this AIB is used, the user port ID must be specified in a V5 Subscriber ID ICB (0x28). In the *PPL Event Indication* message this AIB and the Channel (0x0D) AIB are used for the V5 Layer 3P PSTN protocol. The V5 Configure and V5 Configuration Query messages also use this AIB.

Byte	AIB Field Description	
2	Address Element:	0x2C
3	Data Length	0x02
4	Data[0]	V5 ID (MSB)
5	Data[1]	V5 ID (LSB)

0x2D V5 ID, Link ID

The V5 ID, Link ID address type is used for Link blocking and unblocking.

Byte	AIB Field Description	
2	Address Element:	0x2D
3	Data Length	0x03
4	Data[0]	V5 ID (MSB)
5	Data[1]	V5 ID (LSB)
6	Data[2]	Link ID

0x2F V5 ID, User Port

The V5 ID, User Port address type is used for the following PPL Events: User Port Status Request and V5 Subscriber Query.

Byte	AIB Field Description
2	Address Element: 0x2F
3	Data Length 0x04
4	Data[0] V5 ID (MSB)
5	Data[1] V5 ID (LSB)
6	Data[2] User Port (MSB)
7	Data[3] User Port (LSB)

0x30 V5 ID, User Port, Link, Timeslot

Byte	AIB Field Description	
2	Address Element: 0x30	
3	Data Length	0x06
4	Data[0]	V5 ID (MSB)
5	Data[1]	V5 ID (LSB)
6	Data[2]	Link ID
7	Data[3]	Timeslot
8	Data[4]	User Port (MSB)
9	Data[5]	User Port (LSB)

0x31 SS7 Virtual CIC

Byte	AIB Field Description	
2	Address Element: 0x31	
3	Data Length:	0x07
4	Data[0]	Stack ID
5-8	Data[1-4]	DPC (4 Bytes)
9, 10	Data[5, 6]	CIC

0x32 DS3 Offset

Byte	AIB Field Description	
2	Address Element: 0x32	
3	Data Length:	0x02
4	Data[0]	Slot Number
5	Data[1]	Offset
		This value is always 0.

0x36 MCC

The MCC Group and Channel components use the MCC address type. Currently, the MCC is always 0xFFFFE.

Byte	AIB Field Description	
2	Address Element: 0x36	
3	Data Length:	0x02
4, 5	Data[0, 1]	Handle

0x3A D Channel Data Link Connection Identifier

Byte	AIB Field Description	
2	Address Element: 0x3A	
3	Data Length:	0x04
4	Data[0]	Slot of ISDN card
5	Data[1]	D-Channels Offset (0-31)
6	Data[2]	SAPI
7	Data[3]	TEI

0x3C Number of CICS

Byte	AIB Field Description	
2	Address Element: 0x3C	
3	Data Length:	0x04
4, 5	Data[0, 1]	Logical Span ID (MSB, LSB)
6	Data[2]	Channel
7	Data[3]	Number of Channels

0x3D Ring Configuration Query

Use the Ring Configuration Query AIB to query ring configuration.

Important! If you attempt to query the ring configuration while another query is in progress, the *Response Status* will be 0x3F (Ring Configuration Query Already in Progress)

Byte	AIB Field Description	
2	Address Element: 0x3D	
3	Data Length:	0x01
4	Data[0]	Slot Number of EXNET® Card (Enter 0xFF to query all rings in the system)

0x42 VoIP Module

Byte	AIB Field Description	
2	Address Element: 0x42	
3	Data Length:	0x02
4	Data[0]	Slot Number
5	Data[1]	Module

0x45 Child Conference ID

Use this AIB to create a Child Conference using the *Resource Create* message. The Child Conference ID should be set to 0xFFFF. The AIB in the response to the *Resource Create* message will contain the Parent Conference ID as well as the Child Conference ID, which is allocated by the CSP.

Use this AIB to connect to a Child Conference with the *Resource Connect* message. Indicate the actual Child Conference ID.

Byte	AIB Field Description	
2	Address Element: 0x45	
3	Data Length:	0x04
4, 5	Data[0]	Parent Conference ID
6, 7	Data[1]	Child Conference ID

0x48 Ring Communication Link

This AIB enables synchronizing of an isolated node with a server node in an SS7/EXS multi-node system. If a node gets isolated for a period of time, any changes occurring on that node while it was in isolation get synchronized with the server node. This AIB takes out-of-service (OOS) the ring communication (RCOMM) link between the SS7 in the server node (that controls the remote CICs) and the remote node. An in-service (INS) message will re-establish the link. Messages should be sent to the SS7 server node only. Entry from both ACTIVE and STANBY matrix and SS7 are removed using only one *Service State Configure*. This AIB is only used in *Service State Configure*.

Important! Since this is a brute force mechanism to re-initialize the link, it should be used only rarely. SS7 application tasks are not informed about this link de-configuration so they behave as though the node is still accessible. This AIB should be used only when

there are no calls and no configuration. It should also be used in a pair of OOS and INS.

Byte	AIB Field Description
2	Address Element: 0x48
3	Data Length: 0x02
4	Stack ID
5	Logical Node ID of remote node

0x52 IP Signaling Series 3 Card ID or Expanded Logical Node ID

This AIB is generic. It can be used in any of the newer (introduced in 8.0 and above) Configure and Query messages for any component. If you use this AIB in the *IP Signaling Series 3 Card Configure* message (0x0100) you must also use AIB 0x53.

Byte	AIB Field Description
2	Address Element: 0x52
3	Data Length: 0x02
4	Data[0, 1] Expanded Logical Node ID This field addresses the node/IP Signaling Series 3 Card ID and is used by the host application to route the messages to the proper node/ IP Signaling Series 3 Card. Logical Node ID in the header is ignored (it is set to 0xFE) and Expanded Logical Node ID is used to address the node.

0x53 Object Type

This AIB is generic. It can be used in any Configure and Query message introduced in Release 8.0 and above to configure and query any component. The Object Type field indicates the type of object to be configured, and the Object Instance ID field indicates the ID of the particular instance of the Object in the Object Type field.

Byte	AIB Field Description
2	Address Element: 0x53
3	Data Length: 0x04

Byte	AIB Field Description
4	Data[0, 1] Object Type This field indicates the type of object for which the configuration is meant. For example, to configure an SS7 Series 3 Card, the type is SS7 Stack Type. 0x0001 V.52 Interface 0x0002 SS7 Stack 0x0003 ISDN 0x0004 H323 0x0005 SINAP SS7 0x0020 IP Signaling Series 3 Card Interface 0xFFFF All object types
5, 6	Data[2, 3] Object Instance ID (CSP Matrix Series 3 Card ID) This field addresses the particular instance of the Object listed in the Object Type field. 0xFFFF means that the Object Instance ID does not matter.

0x55 Conference ID

Use this AE with the Slot AE (unless noted) in the following messages:

Play File Start

Play File Stop

Play File Modify

Record File Start

Record File Stop

Record File Modify

System Configuration Query (no Slot AE)

Generic Report (no Slot AE)

Byte	AIB Field Description
2	Address Element: 0x55 Conference ID
3	Data Length: 0x02
4, 5	Data[0, 1]: Conference ID (MSB, LSB)

0x64 Global Object Type

The Global Object Type Address Element defines an object type such as a channel, span, or link. The object type list is common to all objects so no two objects in the system should have the same object type.

Byte	Address Element Field Description	
0	Address Element:	0x64
1	Data Length:	0x02
2, 3	Data[0,1]	0x1000 - SS7 Signaling 0x1001 - SS7 Stack 0x1020 - M3UA 0x1021 - Stack Parameter 0x1022 - Local Application Server 0x1023 - Remote Application Server 0x1024 - Local Application Server Process 0x1025 - Remote Application Server Process 0x1026 - Local Signaling Gateway 0x1027 - Remote Signaling Gateway 0x1028 - Local Signaling Gateway Process 0x1029 - Remote Signaling Gateway Process 0x102A - Route Set 0x102B - Connection

0x65 Global Object ID

The Object ID Address Element always comes after an Object Type and defines a specific instance of the Object Type. Each object has to give the range of valid IDs it can support.

Byte	AIB Field Description	
0	Address Element:	0x65
1	Data Length:	0x02
2,3	Data[0,1]	Object ID Number

0x67 Functional Area

Defines the part of the system affected by the message.

Byte	Address Element Field Description	
2	Address Element	0x67
3	Length	0x02
4,5	Data	0x0001 - Signaling

0x73 IP Signaling Series 3 Card ID

Byte	AIB Field Description
2	Address Element: 0x73
3	Data Length: 0x02
4	Data[0, 1] IP Signaling Series 3 Card ID

0x7F SIP Stack ID

Byte	AIB Field Description
2	Address Element: 0x7F
3	Data Length: 0x04
4	Reserved: 0xFF
5	Stack ID: 0x00
6, 7	Data [0,1] Call Handle. Tied to the Call ID. Used to address a particular SIP dialog. 0xFF 0xFF when querying.

3 Information Control Blocks

Overview

Purpose This chapter lists the Information Control Blocks (ICBs) used in the EXS API for the CSP. The ICBs are listed by type (Action, Data, and Extended Data). The Action ICBs are listed first, then the Data ICBs, and finally the Extended Data ICBs. Within each of these three sections, the ICBs are listed in hexadecimal numerical order.

Introduction to ICBs

Generic ICB Format The table below shows the generic format for an ICB.

ICB Type	
ICB ID	
Data Length	
Data[0]	
:	

ICB Type

0x01 - Action

0x02 - Data

0x03 - Extended

ICB Subtype

The subtype defines the specific action the ICB performs, or the data it contains. The subtype values are defined in the ICB Subtype section of this chapter. In each API message that uses ICBs, the subtypes supported for that message are listed.

Important! Some Action ICB subtype values are used to indicate different ICBs, but they are unique within a particular message. For example, in the *Inseize Control* message, subtype 0x01 is the Report Call Processing Event ICB, while in the *Outseize Control* message, subtype 0x01 is the Scan For Wink N ICB.

Also, a specific ICB may have a different subtype value in different messages. For example, in the *Inseize Control* message, the Report Call Processing Event ICB is subtype 0x01, while in the *Outseize Control* message it is 0x04.

Make sure you use the proper ICB subtype value as defined in the specific API message. Data ICB subtypes are unique system-wide.

ICB Data Length

The length of the data to follow.

ICB Data

The data for each subtype is defined in the ICB Data section of this chapter, and in any API message which supports the subtype. Not all ICBs include data.

In each message, the data for each supported ICB is presented in the following format, if applicable:

ICB Data Length
ICB Data [0]
:

Action ICBs

Most hex IDs are used to represent more than one Action ICB. Two or more ICBs with the same number are never used in the same API message. ICBs marked with an asterisk (*) contain no data, so their data length is zero (0x00) and there is no table in this section.

Hex	Action ICB Name	Used in These Messages
0x00	Null*	<i>Inseize Control, Route Control, Outseize Control</i>
0x01	Free System Resources	<i>Connect With Data</i>
	Report Call Processing Event	<i>Inseize Control</i>
	Scan For Wink N	<i>Route Control, Outseize Control</i>
0x02	Release Mode Configure	<i>Connect With Data</i>
	Generate Call Processing Event	<i>Inseize Control</i>
	Scan For ANI Request Off-hook*	<i>Route Control, Outseize Control</i>
0x03	Receive Stage N Address Data	<i>Inseize Control</i>
	Scan For Dial Tone*	<i>Route Control, Outseize Control</i>

Data Length	0x01
Data[0]	Class 0x00 North American Default 0x01 Dialtone 0x02 CPC Detection 0x03 Energy Detection

0x11 Delay N Milliseconds

Delay values are measured in units of 10 milliseconds. The maximum delay value is 10 seconds (0x03E8).

Used in:

Route Control message*Outseize Control* message

ICB Type	0x01 (Action)
ICB ID	0x11
Data Length	0x02
Data[0]	Delay Value (2 Bytes)

0x35 Query Host Message Registration

This query will return a list of API messages which the specified host is registered to receive (see Response Data).

Used in:

Multi-Host Configure message

ICB Type	0x01 (Action)
ICB ID	0x35
Data Length	0x04
Data[0-3]	Host ID

0x36 Query Host Connections

Used in:

Multi-Host Configure message

ICB Type	0x01 (Action)
ICB ID	0x36
Data Length	Variable
Data[0-3]	Default Host ID (4 bytes) (00 00 00 00 if not connected)
Data[4-5]	Number of hosts connected (2 bytes)
Data[6-9]	Host ID 1 (4 bytes. First connected additional host)
Data[10-13]	Host ID 2 (4 bytes)
:	:
Data[:]	Host ID N (4 bytes)

0x37 Query Multi-Host Status

Used in:

Multi-Host Configure message

ICB Type	0x01 (Action)
ICB ID	0x37
Data Length	Variable
Data[0-3]	Default Host ID (4 bytes)
Data[4]	Status 0x00 - Disabled 0x01 - Enabled

0x38 Query Hard-registered PPL Components

This query will return a list of PPL components from which the specified host is registered to receive *PPL Event Indication* messages (see Response Data).

Used in:

Multi-Host Configure message

ICB Type	0x01 (Action)
ICB ID	0x38
Data Length	0x04
Data[0–3]	Host ID

0x39 Query Soft-registered PPL Components

This query will return a list of PPL components from which the specified host is registered to receive *PPL Event Indication* messages (see Response Data).

Used in:

Multi-Host Configure message

ICB Type	0x01 (Action)
ICB ID	0x39
Data Length	0x04
Data[0–3]	Host ID

0x01 Stage N Address Data

(Host-Supplied Digits)

Stage N Address Data ICBs use either host-supplied outpulsing or previously inpulsed digits. The format of the ICB depends on the type of digits you use.

The format of the Stage N Address Data ICB using host-supplied digits is as follows:

Used in:

Route Control message*Outseize Control* message

ICB Type	0x02 (Data)
ICB ID	0x01
Data Length	Variable
Data[0]	Stage Number (1–4)
Data[1]	0x01 (Host-Supplied Digits)
Data[2]	Outpulsing Signal Type 0x01 DTMF 0x02 MFR1 (host does not include KP or ST) 0x03 MFR2 0x04 MFR1 (host includes KP and any ST signal) 0x05 Dial Pulse
Data[3]	String Count (1 or 2)
Data[4]	String 1: BCD Digit Count
Data[5]	String 1: 1st BCD Digit Pair
:	:
:	String 1: Last BCD Digit Pair
:	String 2: BCD Digit Count
:	String 2: 1st BCD Digit Pair
:	:
:	String 2: Last BCD Digit Pair

0x02 Stage N Address Data

(Previously-Inputted Digits)

The format of the Stage N Address Data ICB using previously inputted digits is as follows:

Used in:

Route Control message*Outseize Control* message

ICB Type	0x02 (Data)
ICB ID	0x02
Data Length	0x07
Data[0]	Stage Number (1–4)
Data[1]	0x02 (Previously Inputted Digits)
Data[2]	Outpulsing Signal Type 0x01 DTMF 0x02 MF1 (host does not include KP or ST) 0x03 MFR2 0x04 MFR1 (host includes KP and any ST signal) 0x06 Dial Pulse 0x06 - Compelled KP (MF-MDR1) (host does not include KP or STI)
Data[3, 4]	Logical Span ID (2 Bytes) (0–63)
Data[5]	Channel
Data[6]	Stage Number (1–4)

0x10 ISDN Formatted IEs

Used in:

Channel Release Request, Channel Released With Data, Release Channel with Data, Request For Service With Data, Route Control, Outseize Control, PPL Event Indication, PPL Event Request messages

ICB Type	0x02 (Data)
ICB ID	0x10
Data Length	Variable
Data[0]	Number of IEs (0–30)

Data[1]	IE 1 Type 0x01 Call Reference 0x02 Called Party Number 0x03 Calling Party Number 0x04 Called Party Subaddress 0x05 Calling Party Subaddress 0x06 Redirecting Number 0x07 Cause 0x08 Progress 0x09 User to User 0x0A Codeset 6 0x0B Codeset 7 0x0C Reserved 0x0D Reserved 0x0E Reserved 0x0F Reserved 0x10 Reserved 0x11 Codeset 5 0x12 Vari-A-Bill

Data[:]	IE n Type
Data[:]	IE n Length (0–130)
Data[:]	IE n Data[0]

0x11 ISDN Raw IEs

Any Raw IE can be inserted by the host for proprietary applications. Raw IEs will be inserted after any Formatted IEs (consult Q.931). The Q.931 recommendation specifies the format of the Raw IEs. IEs are always validated before issuing them in an ISDN message. The ISDN protocols ensure that the mandatory IEs are included with each ISDN message. See *ITU-T Q.931* for a list of valid Raw IEs.

Used in:

Channel Release Request, Channel Released With Data, Release Channel with Data, Request For Service With Data, Route Control, Outseize Control, PPL Event Indication, PPL Event Request messages

ICB Type	0x02 (Data)
ICB ID	0x11
Data Length	Variable
Data[0]	Number of IEs (0–30)
Data[1]	IE Type (see ITU-T Q.931)
Data[2]	IE Length (0–130)
Data[3]	IE Data[0]

0x12 SS7 Parameters

Used in:

Channel Release Request, Channel Released With Data, Connect With Data, Release Channel with Data, Route Control, Outseize Control, PPL Event Indication, PPL Event Request messages.

ICB Type	0x02 (Data)
ICB ID	0x12
Data Length	Variable
ISUP Message ID	See the list of supported ANSI ISUP message types, in the <i>API Developer's Guide: Common Channel Signaling</i> .
Data[0]	Number of Parameters
Data[1]	Parameter 1 Type
Data[2]	Parameter 1 Length

Data[:]	Parameter n Length
Data[:]	Parameter n Data[0] (consult ANSI or ITU-TS recommendations for data)

0x14 PPL Argument 2 Data

Used in:

PPL Event Request message

ICB Type	0x12 (Data)
ICB ID	0x14
Data Length	0x01
Data[0]	State Number (0-255)

0x15 DASS2/DPNSS Raw Data

The DASS2/DPNSS Raw Data ICB is a Raw DASS2/DPNSS frame that starts at the message/group octet (it does not include the address and control octets).

Used in:

Route Control message

Outseize Control message

ICB Type	0x02 (Data)
ICB ID	0x15
Data Length	Variable
Data[0]	Raw DASS2/DPNSS Message/Group Octet
Data[1]	Remaining DASS2/DPNSS Frame

0x16 SS7 Protocol Violation Data

Used in:

PPL Event Indication message*PPL Event Request* message

ICB Type	0x02 (Data)
ICB ID	0x16
Data Length	0x05
Data[0, 1]	PPL Component ID
Data[2]	<p>Error Type</p> <p>NOTE: Entries marked with a dagger (†) report the ISUP message type only and do not report an ISUP parameter.</p> <p>0x01† Unrecognized Message Type</p> <p>0x02 Unrecognized Parameter ID</p> <p>0x03 Minimum Parameter Length Violation</p> <p>0x04 Maximum Parameter Length Violation</p> <p>0x05† Corrupt Parameter Data</p> <p>0x06† Mandatory Parameters Missing</p> <p>0x07 Range Field of Range/Status Parameter is zero</p>
Data[3]	<p>ISUP Message ID</p> <p>To see a list of supported ANSI ISUP message types, refer to the SS7 Chapter in the API Developer's Guide: Common Channel Signaling</p>
Data[4]	<p>ISUP Parameter ID</p> <p>See the API Developer's Guide: CCS. If the value of the Error Type field is marked with a †, the value of this field is 0x00.</p>

0x17 ISDN Formatted IEs With Event

Used in:

Connect with Data message

ICB Type	0x02 (Data)
ICB ID	0x17
Data Length	Variable
Data[0, 1]	Event
Data[2]	Number of IEs (0–30)

Data[3]	IE Type 0x01 Call Reference 0x02 Called Party Number 0x03 Calling Party Number 0x04 Called Party Subaddress 0x05 Calling Party Subaddress 0x06 Redirecting Number 0x07 Cause 0x08 Progress Indicator 0x09 User-to-User 0x0A Codeset 6 0x0B Codeset 7 0x0C Reserved 0x0D Reserved 0x0E Reserved 0x0F Reserved 0x10 Reserved 0x11 Codeset 5 0x12 Vari-A-Bill
Data[4]	IE Length (0–130)
Data[5]	IE Data[0]

0x18 ISDN Raw IEs with Event

You can insert any valid IE into this ICB. The ISDN messages listed below have the listed IEs automatically inserted unless overridden by the host. All other messages have no IEs automatically inserted.

SETUP

- Call Reference (Formatted IE)
- Bearer Capability (Raw IE)
- Network-specific IE (Raw IE) (Unless B channel's Network Type is set to 1, see *B Channel Configure*)
- Channel ID (will always be inserted for Primary Rate, cannot be inserted by host)

RELEASE

- Cause (Formatted IE)

Used in:

Connect with Data message

ICB Type	0x02 (Data)
ICB ID	0x18
Data Length	Variable
Data[0, 1]	Event
Data[2]	Number of IEs (0–30)

Data[3]	IE Type (see ITU-T Q.931)
Data[4]	IE Length (0–130)
Data[5]	IE Data[0]

0x1A Call Type

Call Types:

0x0001L3P Controlled

0x0002 Host Controlled

If the value of the Call Type field is 0x0001, the remaining data fields Data[2] through Data[n], represent the digits of the called party number.

The called party digits are noted in ASCII/IA5 format. For example, the digit “5” is indicated as 0x35.

If the value of the Call Type field is 0x0002, data fields Data[2] through Data[n] are not included in the ICB.

Used in:

Route Control message

Outseize Control message

ICB Type	0x02 (Data)
ICB ID	0x1A
Data Length	Variable
Data[0, 1]	Call Type MSB, LSB
Data[2]	Called Party Digit
Data[3]	Called Party Digit
Data[4]	Called Party Digit

0x1C SS7 TUP Formatted Fields

Used in:

Channel Release Request, Channel Released With Data, Connect With Data, Release Channel with Data, Route Control, Outseize Control, PPL Event Indication, PPL Event Request messages.

ICB Type	0x02 (Data)
ICB ID	0x1C
Data Length	Variable
Data[0, 1]	TUP Message Group/Type
Data[2]	Number of Fields (variable)
Data[3]	Field 1 ID (Refer to the <i>TUP Message Format Configure</i> message)
Data[4]	Field 1 Data Length (variable)
Data[5]	Field 1 Data[0]

Data[:]	Field n ID (Refer to the <i>TUP Message Format Configure</i> message)
Data[:]	Field n Data Length (variable)
Data[:]	Field n Data[0]

0x1E Generic PPL

This ICB is used in various scenarios including call routing and establishing IP calls.

Used in:

Route Control message

PPL Event Indication message

PPL Event Request message

Channel Release with Data message

ICB Type	0x02 (Data)
ICB ID	0x1E

0x1F SS7 Unformatted Raw Parameters

This ICB is used to send the unrecognized message/message received on unequipped CIC from SPRC. The data bytes contain the entire ISUP message.

Used in:

PPL Event Indication message

ICB Type	0x02 (Data)
ICB ID	0x1F
Data Length	Variable
Data[0-3]	DPC (OPC of the message originator)

Data[4-5]	CIC
Data[6]	ISUP Message ID See the Appendix in the <i>API Developer's Guide: Common Channel Signaling</i> . For a full listing, see ITU Q.763 or ANSI T1.113.
Data[n]	SS7 Raw Data for message including pointers. (Structure depends on SS7 message received.)

0x20 SS7 SCCP Parameters

Used in:

PPL Event Indication message

PPL Event Request message

ICB Type	0x02 (Data)
ICB ID	0x20
Data Length	Variable
Data[0]	Raw Parameter Data: Parameter Length Data
Data[n]	:

0x21 SS7 TCAP Parameters

Used in:

PPL Event Indication message

PPL Event Request message

ICB Type	0x02 (Data)
ICB ID	0x21
ICB Length	Variable
TCAP Dialogue ID (4 Bytes)	
Parameter Type (2 Bytes)	
Parameter Length (2 Bytes)	
Parameter Data	

0x22 Raw SS7 Data Parameters

This ICB is a general purpose one used to indicate different data formats. For example, it is used in the PPL event indications of CQS (Circuit Query Sending) to indicate local and remote status. Data definitions for this can be found in the *API Developer's Guide: Common Channel Signaling*. This ICB is also used by CVT (Circuit Validation Test) procedure for PPL event indications from component

CVS (Circuit Validation Sending.). This ICB is also included in the ISUP CPC (0x0012) PPL event indication 0x4E. For more data information on this refer to the *Developer's Guide: Common Channel Signaling, PPL Events*.

ICB Type	0x02 (Data)
ICB ID	0x22
Data Length	Variable
Data[0]	Raw Parameter Data: Parameter Length Data
:	:
Data[n]	:

0x23 BT IUP Parameters

The BT IUP Parameters ICB (0x23) is used to transport any BT IUP Parameters message between the host and the CSP.

Important! In general, messages will contain one BT IUP ICB with one or more BT IUP TLVs.

ICB Type	0x02 (Data)
ICB ID	0x23
Data Length	Variable
Data[0]	Tag value corresponding to a unique element of a BT IUP message.
Data[1]	Number of bytes to follow (usually 0x02)
Data[2]	H0 (See following table.)
Data[3]	H1 (See following table.)
Data[2+]	Message Data

Message Types

The following table lists the messages in alphabetical order. The table also includes the H0 and H1 octets in binary code and the decimal code in brackets.

Message Title	Message Group Code (H0)	Message Type Code (H1)

Data[0-7]	Event Data

Extended Data ICBs

0x0012 SS7 Formatted Parameters

The SS7 Formatted Parameters Extended Data ICB supports Data greater than 255 bytes for call processing with ISUP messages.

For an SS7 channel in ANSI ISUP CRM/CRA, the *Outseize Control* message must include an SS7 Parameters ICB. This allows a CRM message type to be part of the SS7 Parameter ICB that is sent in the *Outseize Control* message. To send an IAM message after an *Outseize Control* message with CRM, a separate *PPL Event Request* for IAM must be made.

Used in:

Outseize Control message

ICB Length	Length of parameters, in bytes
Data[0]	Parameter 1 Type ID
Data[1]	Length of parameter 1 data in bytes

Data[2]	Parameter 1 Value Variable size
:	
Data[:]	Parameter n Type ID
Data[:]	Length of parameter n data in bytes
Data[:]	Parameter n Value Variable size

PPL Parameters

ICB Type	0x03 (Extended Data)
ICB ID	0x0424
Data Length	0x000D
2 bytes	
Data[0-3]	DPC - Destination Point Code
Data[4-7]	OPC - Originating Point Code
Data[8-9]	CIC - Circuit ID Code
Data[10]	SI - Service Indicator
Data[11]	MP - Message Priority
Data[12]	NI - Network Indicator

ICB Type	0x03 (Extended Data)
ICB ID	0x0425
Data Length	0x000C
2 bytes	
Data[0-3]	DPC - Destination Point Code
Data[4-7]	OPC - Originating Point Code
Data[8]	SI - Service Indicator
Data[9]	MP - Message Priority
Data[10]	NI - Network Indicator
Data[11]	SLS - Signaling Link Set

ICB Type	0x03 (Extended Data)
ICB ID	0x0426

Data Length	Up to 0x010E
2 bytes	
Data[0-1]	Length - Length of MSU Data
Data[4-n]	MSU Data - Length up to 0x010C

ICB Type	0x03 (Extended Data)
ICB ID	0x0427
Data Length	0x0006
2 bytes	

Data[0-3]	Affected DPC
Data[4]	<p>Cause Value</p> <p>Value 0 - congestion level 0</p> <p>Value 1 - congestion level 1</p> <p>Value 2 - congestion level 2</p> <p>Value 3 - congestion level 3</p> <p>Value 4 - User Part Unavailable</p> <p>Value 5 - User Part Unequipped</p> <p>Value 6 - User Part Inaccessible</p> <p>Value 7 - Signaling Link Congestion level 0</p> <p>Value 8 - Signaling Link Congestion level 1</p> <p>Value 9: Signaling Link Congestion level 2</p> <p>Value 10: Signaling Link Congestion level 3</p> <p>Value 11: Signaling Link Congestion level 4</p>
Data[5]	User Information Octet value

0x002C V5 User Port Range

This ICB is used for call processing messages to and from Layer 3.

Used in:

PPL Event Indication message

PPL Event Request message

ICB Type	0x03 (Extended Data)
ICB ID Data[1, 2]	0x002C
Data Length Data[3, 4]	(0x00, 0x04), (2 Bytes)
Data[5, 6]	User Ports From (MSB, LSB), (2 Bytes)
Data[7, 8]	User Ports To (MSB, LSB), (2 Bytes)

0x002D Q.752 Parameter

See MTP Parameter IDs from Q.752 for specific Parameter ID information. The format for the Q.752 Parameter is as follows:

Used in:

PPL Event Indication message

ICB Type	0x03 (Extended Data)
ICB ID	0x002D (Q.752 parameters)
ICB Length	(2 Bytes) Length of parameters, in bytes
Parameter 1 Type	(2 Bytes) Parameter Type ID
Parameter 1 Length	(2 Bytes) Length of parameter data in bytes
Parameter 1 Value	Variable size
:	
Parameter n Type	(2 Bytes) Parameter Type ID
Parameter n Length	(2 Bytes) Length of parameter data in bytes
Parameter n Value	Variable

0x002F V5 Statistics Query

This ICB subtype is sent from the host using *PPL Event Request* message for Envelope Layer, LAPV, PSTN, BCC, Control Protocol, Protection Protocol, Link Protocol, and System Management Statistics. The Statistics return to the host in a *PPL Event Indication* message. After receiving V5 Statistics Query from the host, L3P Layer Manager sends a Positive Acknowledgment back to the host, indicating that L3P Layer Manager received the request.

Used in:

PPL Event Request message

PPL Event Indication message

ICB Type	0x03 (Extended Data)
ICB ID Data[1, 2]	0x002F
Data Length Data[3, 4]	(0x00, 0x04), (2 Bytes)
Data[5]	Query Type (0x01, 0x02)
Data[6]	Query Subtype (0x00 - 0x09)
Data[7]	Type (0x00 - 0x07)
Data[8, 9]	C Channel No. or Port No. (MSB, LSB)

Query Types

0x01 V5 Statistics and zero statistics counters

0x02 V5 Statistics and don't zero statistics counters

Query Subtypes

0x00 All Protocol Statistics

0x01 V5.2 ENVELOPE Layer Statistics

0x02 V5.2 LAPV Statistics

0x03 V5.2 PSTN Statistics

0x04 V5.2 CONTROL Protocol Statistics

0x05 V5.2 BCC Protocol Statistics

0x06 V5.2 LINK Protocol Statistics

0x07 V5.2 PROTECTION Protocol Data Link Statistics

0x08 V5.2 PROTECTION Protocol Interface Statistics

0x09 V5.2 SYSTEM MANAGEMENT Statistics

Type

0x00 No Type

The following types are valid for V5.2 LAPV Statistics:

0x01 PSTN Data Link

0x02 BCC Data Link

0x03 CONTROL Data Link

0x04 LINK

0x05 PRIMARY PROTECTION Data Link

0x06 SECONDARY PROTECTION Data Link

C Channel Number

Valid for V5.2 ENVELOPE Layer Statistics and V5.2 PROTECTION Protocol Statistics:

- 0x00 Primary C Channel
- 0x01 Secondary C Channel

Port Number

User port number, and is valid for V5.2 SYSTEM MANAGEMENT Statistics.

0x0030 V5 Statistics Data

Used in:
PPL Event Indication message

ICB Type	0x03 (Extended Data)
ICB ID	0x0030
Data[1, 2]	
Data Length	(MSB, LSB), (2 Bytes)
Data[3, 4]	
Data[5]	Data[0]
Data[6]	Data[1]
:	:
Data[N+3]	Data[N]

The following statistics values are sent to the host in the ICB Data:

Data[0] = Query Subtype

Query Subtypes:

- 0x00 All Protocol Statics
- 0x01 V5.2 ENVELOPE Layer Statistics
- 0x02 V5.2 LAPV Statistics
- 0x03 V5.2 PSTN Statistics
- 0x04 V5.2 CONTROL Protocol Statistics
- 0x05 V5.2 BCC Protocol Statistics
- 0x06 V5.2 LINK Protocol Statistics
- 0x07 V5.2 PROTECTION Protocol Data Link Statistics
- 0x08 V5.2 PROTECTION Protocol Interface Statistics
- 0x09 V5.2 SYSTEM MANAGEMENT Statistics

Each data Variable is 4 Bytes long.

Data[1] means Data[1,2,3,4] bytes

Query Subtype 0: For All Protocols

Data for PSTN Protocol Statistics:

- Data[1] Number of Establish messages transmitted
- Data[5] Number of Establish ack messages transmitted
- Data[9] Number of Signal messages transmitted
- Data[13] Number of Signal acknowledge messages transmitted
- Data[17] Number of Status messages transmitted
- Data[21] Number of Status enquiry messages transmitted
- Data[25] Number of Disconnect messages transmitted
- Data[29] Number of Disconnect complete messages transmitted
- Data[33] Number of Protocol parameter messages transmitted
- Data[37] Number of Establish messages received
- Data[41] Number of Establish ack messages received
- Data[45] Number of Signal messages received
- Data[49] Number of Signal acknowledge messages received
- Data[53] Number of Status messages received
- Data[57] Number of Status enquiry messages received
- Data[61] Number of Disconnect messages received
- Data[65] Number of Disconnect complete messages received
- Data[69] Number of Protocol parameter messages received
- Data[73] Total connections established so far
- Data[77] Number of currently active connections

Data for Control Protocol Statistics:

- Data[81] Port control transmitted
- Data[85] Port control ack transmitted

Data[89] Common control transmitted
Data[93] Common control ack transmitted
Data[97] Port control received
Data[101] Port control ack received
Data[105] Common control received
Data[109] Common control ack received

Data for BCC Protocol Statistics:

Data[113] Allocation messages transmitted
Data[117] Allocation messages received
Data[121] Deallocation requests transmitted
Data[125] Decollating requests received
Data[129] Allocation rejects transmitted
Data[133] Allocation rejects received
Data[137] Allocation complete transmitted
Data[141] Allocation complete received
Data[145] Deallocation complete transmitted
Data[149] Deallocation complete received
Data[153] Audit transmitted
Data[157] Audit received
Data[161] Audit complete transmitted
Data[165] Audit complete received
Data[169] Fault transmitted
Data[173] Fault received
Data[177] Fault ack transmitted
Data[181] Fault ack received

Data[185] Protocol error transmitted

Data[189] Protocol error received

Data for LINK Protocol Statistics:

Data[193] Number of Link Control transmitted

Data[197] Number of Link Control received

Data[201] Number of Link Control Ack transmitted

Data[205] Number of Link Control Ack received

Data for PROTECTION Protocol Data Link:
(Statistics for Primary C Channel)

Data[209] Number of messages transmitted

Data[213] Number of messages received

Data for PROTECTION Protocol Data Link:
(Statistics for Secondary C Channel)

Data[217] Number of messages transmitted

Data[221] Number of messages received

Data for PROTECTION Protocol Interface Statistics:

Data[225] Number of Switchover request transmitted

Data[229] Number of Switchover request received

Data[233] Number of Switchover command transmitted

Data[237] Number of Switchover command received

Data[241] Number of Operator initiated switchover command
transmitted

Data[245] Number of Operator initiated switchover command
received

Data[249] Number of Switchover ack transmitted
Data[253] Number of Switchover ack received
Data[257] Number of Switchover reject transmitted
Data[261] Number of Switchover reject received
Data[265] Number of Reset sequence number command transmitted
Data[269] Number of Reset sequence number command received.
Data[273] Number of Reset sequence number ack transmitted
Data[277] Number of Reset sequence number ack received
Data[281] Number of Protocol error transmitted
Data[285] Number of Protocol error received

Data for SYSTEM MANAGEMENT Statistics:

Data[289] Number of times the ISDN port status T1 timer expired

Query Subtype 1: V5.2 ENVELOPE Layer Statistics:

Data[1] Number of Information frames transmitted
Data[5] Number of Information frames received
Data[9] Number of frames dropped

Query Subtype 2: V5.2 LAPV Statistics:

Data[1] Information frames transmitted
Data[5] Receive ready frames transmitted
Data[9] Receive not ready frames transmitted
Data[13] Reject frames transmitted
Data[17] Set asynchronous balanced mode frames transmitted
Data[21] Unnumbered acknowledge frames transmitted
Data[25] Disconnect mode frames transmitted
Data[29] Information frames transmitted

Data[33] Receive ready frames transmitted
Data[37] Receive not ready frames transmitted
Data[41] Reject frames received
Data[45] Set asynchronous balanced mode frames received
Data[49] Unnumbered acknowledge frames received
Data[53] Disconnect mode frames received
Data[57] Invalid frames received
Data[61] Set asynchronous balanced mode errors

Query Subtype 3: V5.2 PSTN Statistics:

Data[1] Number of Establish messages transmitted
Data[5] Number of Establish ack messages transmitted
Data[9] Number of Signal messages transmitted
Data[13] Number of Signal acknowledge messages transmitted
Data[17] Number of Status messages transmitted
Data[21] Number of Status enquiry messages transmitted
Data[25] Number of Disconnect messages transmitted
Data[29] Number of Disconnect complete messages transmitted
Data[33] Number of Protocol parameter messages transmitted
Data[37] Number of Establish messages received
Data[41] Number of Establish ack messages received
Data[45] Number of Signal messages received
Data[49] Number of Signal acknowledge messages received
Data[53] Number of Status messages received
Data[57] Number of Status enquiry messages received
Data[61] Number of Disconnect messages received
Data[65] Number of Disconnect complete messages received

Data[69] Number of Protocol parameter messages received

Data[73] Total connections established so far

Data[77] Number of currently active connections

Query Subtype 4: V5.2 CONTROL Protocol Statistics:

Data[1] Port control transmitted

Data[5] Port control ack transmitted

Data[9] Common control transmitted

Data[13] Common control ack transmitted

Data[17] Port control received

Data[21] Port control ack received

Data[25] Common control received

Data[29] Common control ack received

Query Subtype 5: V5.2 BCC Protocol Statistics:

Data[1] Allocation messages transmitted

Data[5] Allocation messages received

Data[9] Deallocation requests transmitted

Data[13] Decollating requests received

Data[17] Allocation rejects transmitted

Data[21] Allocation rejects received

Data[25] Allocation complete transmitted.

Data[29] Allocation complete received

Data[33] Deallocation complete transmitted

Data[37] Deallocation complete received

Data[41] Audit transmitted

Data[45] Audit received

Data[49] Audit complete transmitted

Data[53] Audit complete received

Data[57] Fault transmitted

Data[61] Fault received

Data[65] Fault ack transmitted

Data[69] Fault ack received

Data[73] Protocol error transmitted

Data[77] Protocol error received

Query Subtype 6: V5.2 LINK protocol Statistics:

Data[1] Number of Link Control transmitted

Data[5] Number of Link Control received

Data[9] Number of Link Control Ack transmitted

Data[13] Number of Link Control Ack received

Query Subtype 7: V5.2 PROTECTION Protocol Datalink Statistics:

Data[1] Number of messages transmitted

Data[5] Number of messages received

Query Subtype 8: V5.2 PROTECTION Protocol Interface:

Data[1] Number of Switchover request transmitted

Data[5] Number of Switchover request received

Data[9] Number of Switchover command transmitted

Data[13] Number of Switchover command received

Data[17] Number of Operator initiated switchover command transmitted

Data[21] Number of Operator initiated switchover command received

Data[25] Number of Switchover ack transmitted

Data[29] Number of Switchover ack received

- Data[33] Number of Switchover reject transmitted
- Data[37] Number of Switchover reject received
- Data[41] Number of Reset sequence number command transmitted
- Data[45] Number of Reset sequence number command received
- Data[49] Number of Reset sequence number ack transmitted
- Data[53] Number of Reset sequence number ack received
- Data[57] Number of Protocol error transmitted
- Data[61] Number of Protocol error received

Query Subtype 9: V5.2 SYSTEM MANAGEMENT Statistics:

- Data[1] Number of times the ISDN port status T1 timer expired

0x0031 V5 Status Indication

This ICB is sent from the CSP in a *PPL Event Indication* message for specifying the V5 Status Indications.

Used in:

PPL Event Indication message

ICB Type	0x03 (Extended Data)
ICB ID Data[1, 2]	0x0031
Data Length Data[3, 4]	(MSB, LSB), (2 Bytes)
Data[5]	Data[0] Reason

When PPL Config byte 6 of component 0x93 is set to '0' the following Events and Reasons are sent to host:

Event	Reason	Description
2	0	Invalid entity, instance
	1	Configuration already done
	2	Cannot allocate memory
	7	Invalid port type
	8	Ports exceed max ports
	9	Port already present
	10	Invalid element type
	11	Invalid interface number
	131	Link already present
	132	Maximum links already present
	143	Port insert into hash list failed
3	77	Port/all ports deleted
	78	Interface deleted
	79	All links/link deleted
	80	All ports blocked
	81	All links blocked
	144	Accelerated port align OK
5	0	Invalid entity, instance
	11	Invalid interface number
	12	Invalid port ID
	13	Invalid unsolicited action
	74	Invalid trace generation action
	75	Invalid subaction parameter
	76	Invalid element type
	77	Delete port error
	78	Delete interface error
	79	Delete link error
	80	Block port error
	81	Block link error
6	0	Invalid entity and instance
	11	Invalid interface number
	12	Invalid port ID
	134	Invalid port type
	135	Invalid link number
7	0	Invalid entity, instance
	12	Invalid port ID
8	87	Port control protocol: Event out of sequence
	88	Port control protocol: Saved events already reaching limit
	89	Port control protocol: Timer T1 expired twice

10	82	Variant and ID mismatch
	83	V5.1 FSM reporting control protocol DL failure
	84	V5.1 FSM timer expiry
	85	V5.2 interface FSM receiving bad input event
	124	Accelerated port alignment failed
	136	V5.1 FSM getting a bad input event
11	0	Layer 4 unable to bind/unbind to Layer 3
12	86	Invalid message
	90	Message decode error
	99	Invalid Message length
	102	Protocol discriminator error
	103	Layer 3 address error
	104	Invalid message type
	105	Invalid message content
106	Invalid optional IE	
13	90	BCC protocol error msg received
14	91	Layer 4 primitive failed, resource unavailable
15	90	BCC/protection protocol state-event matrix received invalid event
16	98	Layer 4 primitive failed, requested TSAP not found
17	89	Control protocol TCON timer expired
18	82	Startup-Variant ID mismatch
	110	Startup-Layer 2 activation fail
	111	Startup-Link ID failed
	112	Startup complete
	113	Startup failed
19	89	Restart timer expired. Restart failed
	146	Restart complete
22	126	Switchover failed
	127	Switchover complete
	142	Switchover reject received
23	97	Protection protocol message send failure, both DLs down
	108	Message Send failure, invalid Protocol FSM state
24	108	Message received in an invalid protocol FSM state
26	145	Port FSM received an invalid event

28	15	Port unblock indication
	17	Port block indication
	21	Grading information
	50	Unsuccessful activation attempt
	52	Reception of FE2
	62	User failure indication
	63	Network failure indication
30	92	Protection protocol: reset SN error
1	93	Generating protocol error message
1	139	Notification to layer manager of SN misalignment. Layer 3 resets the SN values
1	140	Reset SN indication after action on reset SN Req
1	141	Reset SN acknowledge reception indication
31	92	TSO4 expires
	94	Switchover message not responded to, timer expires
	109	Second expiry of Link Control Protocol Timer
	139	Reset SN acknowledge not received, timer expiry
34	0	Link Dead
	1	Link Up
	3	Remotely blocked
	5	Locally blocked
35	0	C Channel dead
	1	C Channel alive
	2	C Channel blocked
	3	C Channel active
36	0	Interface down
	1	Interface alive
37	0	Port Out of Service (OOS)
	1	Port alive
	2	Port blocked

When PPL Config byte 6 of component 0x93 is set to '1' the following Events and Reasons are sent to host.

Event	Reason	Description
1	3	General Config OK
	4	TSAP Config OK
	5	Interface Config OK
	6	Port Config OK
	133	Link Config OK

2	0	Invalid entity, instance
	1	Configuration already done
	2	Cannot allocate memory
	7	Invalid port type
	8	Ports exceed max ports
	9	Port already present
	10	Invalid element type
	11	Invalid interface number
	131	Link already present
	132	Maximum links already present
	143	Port insert into hash list failed
3	77	Port/all ports deleted
	78	Interface deleted
	79	All links/link deleted
	80	All ports blocked
	81	All links blocked
	144	Accelerated port align OK
4	61	Link operational
	62	Link not operational
	63	Link ID required
	64	Link ID request
	66	Link ID release indication
	67	Link ID reject indication
	68	Link ID failure
	69	Link block indication
	70	Link unblock request
	71	Link unblock indication
	72	Link block request: deferred
	73	Link block request: non-deferred
5	0	Invalid entity, instance
	11	Invalid interface number
	12	Invalid port ID
	13	Invalid unsolicited action
	74	Invalid trace generation action
	75	Invalid subaction parameter
	76	Invalid element type
	77	Delete port error
	78	Delete interface error
	79	Delete link error
	80	Block port error
	81	Block link error

6	0	Invalid entity and instance
	11	Invalid interface number
	12	Invalid port ID
	134	Invalid port type
	135	Invalid link number
7	0	Invalid entity, instance
	12	Invalid port ID
8	87	Port control protocol: Event out of sequence
	88	Port control protocol: Saved events already reaching limit
	89	Port control protocol: Timer T1 expired twice
9	87	Common control protocol: Event out of sequence
	88	Common control protocol: Saved events already reaching limit
	89	Common control protocol: Timer T2 expired twice
10	82	Variant and ID mismatch
	83	V5.1 FSM reporting control protocol DL failure
	84	V5.1 FSM timer expiry
	85	V5.2 interface FSM receiving bad input event

0x0033 NPDI Universal ICB

The *Route Control* message is sent with the following ICB to obtain a span/channel for an incoming call. This ICB is required for IP and Interworking calls.

The NPDI SIP Response Code TLV (0x2915) appears in this ICB when it is used in the *Channel Released with Data* message and *Release Channel with Data* messages. This ICB is required for the VDAC-ONE and IP Network Interface Series 2 cards.

This ICB is required to support Frequency Shift Keying for the DSP Series 2 card.

The maximum recommended NPDI size is as follows:

- 780 for the *Route Control* message (including the NPDI ICB size)
- 820 bytes for *Outseize Control* message and the other messages below (including the NPDI ICB size)

Used in:

- Outseize Control* message
- PPL Event Indication* message
- PPL Event Request* message
- Route Control* message
- Connect with Data* message
- Request for Service with Data* message
- Channel Released with Data* message
- Release Channel with Data* message

ICB Type	0x03 (Extended Data)

SS7 and ISDN Values

This section provides data values required for SS7 ICBs, including the following:

- SS7 Parameter IDs
- MTP Statistics Parameter IDs from Q.752

See “SS7 ISUP Message Format Configure 0x6B” for a list of ISUP Message IDs.

SS7 Parameter IDs

The following is a partial list of SS7 parameters. For a complete list and coding, consult the appropriate ANSI or ITU specification.

0x03	Access transport
0x27	Automatic congestion level
0x11	Backward call indicators
0xC6	Business group
0x01	Call reference
0x04	Called party number
0x0A	Calling party number
0x09	Calling party's category
0xC5	Carrier identification
0xEE	Carrier selection information
0x12	Cause indicators
0xEB	Charge number
0x0D	Connection request
0xC3	Egress service
0x07	Forward call indicators
0xC0	Generic address
0xC1	Generic digits
0x0F	Information indicators
0x0E	Information request indicators
0xC4	Jurisdiction
0x06	Nature of connection indicators
0xEF	Network transport
0xE1	Notification indicator
0x29	Optional backward call indicators
0x28	Original called number
0xEA	Originating line information
0x13	Redirection information
0x0B	Redirection number
0xE2	Service activation

0x03	Access transport
0xEC	Service code indicator
0xED	Special processing request
0xE3	Transaction request
0x23	Transit network selection
0x1D	User service information

MTP Parameter IDs from Q.752

Parameter length for each ID listed below is 0x0004 except where noted.

0x0000	<p>MTP3 Timestamp</p> <p>This value is a 1msec resolution, modulus 2^{32} timestamp derived from the internal processing logic of MTP3. The datum of this timestamp is established internally by each MTP3 at the time the signalling stack is configured and cannot be set.</p> <p>As presented, the timestamp should only be used for relative timing of MTP3 Q.752 events and reports within a signaling stack. The timestamp for interval reports identify the time associated with the end of the reporting interval and not the time of the actual report. Consequently, host attempts to correlate the timestamp to a time datum must consider only the 1st interval report of a sequence for this correlation.</p>
0x0001	<p>Interval sequence number</p> <p>This value is a modulus 2^{32} sequence number which identifies the reporting interval. The initial value for the first reporting interval following start or restart of interval reporting is 1.</p>
0x0002	Duration of the link in-service state
0x0003	Duration of the link unavailable state
0x0004	Duration of the link local inhibit state
0x0005	Duration of the link remote inhibit state
0x0006	Duration of the link failed state
0x0007	Duration of the link remote blocked state
0x0008	Count of link failures
0x0009	Count of link restorations
0x000A	Count of link failures due to an abnormal FIBR/BSNR
0x000B	Count of link failures due to delayed ACK
0x000C	Count of link failures due to error rate
0x000D	Count of link failures due to excessive congestion duration
0x000E	Count of link failures due to remote LSSU received
0x000F	Count of link failures due to link test failures
0x0010	Count of link alignment failures
0x0011	Count of link SUs received in error
0x0012	Count of link NACKs received
0x0013	Count of MSUs transmitted
0x0014	Count of octets transmitted
0x0015	Count of link octets retransmitted
0x0016	Count of MSUs received
0x0017	Count of octets received
0x0018	Duration of inaccessibility
0x0019	Count of MSUs discarded during routing

0x001A	Count of MSUs discarded during discrimination
0x001B	Counts of UPUs transmitted for each user part (Parameter Length=0x0040)
0x001C	Counts of UPUs received for each user part (Parameter Length=0x0040)
0x001D	Link failure reason code 0x0001 Abnormal FIBR/BSNR 0x0002 Excessive delayed ACK (T7) 0x0003 Excessive error rate 0x0004 Excessive duration of congestion (T6) 0x0005 LSSU received (SIOS, SIO, SIN, SIE) 0x0006 Changeover MSU received 0x0007 Other
0x001E	User part identifier

ISDN Values

This section provides data values required for ISDN ICBs, including:

- Information Elements
- IE Fields
- Cause Codes

Parameter length for each ID listed below is 0x0004 except where noted.

0x0000	MTP3 Timestamp This value is a 1msec resolution, modulus 2 ³² timestamp derived from the internal processing logic of MTP3. The datum of this timestamp is established internally by each MTP3 at the time the signalling stack is configured and cannot be set. As presented, the timestamp should only be used for relative timing of MTP3 Q.752 events and reports within a signaling stack. The timestamp for interval reports identify the time associated with the end of the reporting interval and not the time of the actual report. Consequently, host attempts to correlate the timestamp to a time datum must consider only the 1 st interval report of a sequence for this correlation.
0x0001	Interval sequence number This value is a modulus 2 ³² sequence number which identifies the reporting interval. The initial value for the first reporting interval following start or restart of interval reporting is 1.
0x0002	Duration of the link in-service state
0x0003	Duration of the link unavailable state
0x0004	Duration of the link local inhibit state
0x0005	Duration of the link remote inhibit state
0x0006	Duration of the link failed state
0x0007	Duration of the link remote blocked state
0x0008	Count of link failures
0x0009	Count of link restorations
0x000A	Count of link failures due to an abnormal FIBR/BSNR
0x000B	Count of link failures due to delayed ACK
0x000C	Count of link failures due to error rate
0x000D	Count of link failures due to excessive congestion duration
0x000E	Count of link failures due to remote LSSU received

0x000F	Count of link failures due to link test failures
0x0010	Count of link alignment failures
0x0011	Count of link SUs received in error
0x0012	Count of link NACKs received
0x0013	Count of MSUs transmitted
0x0014	Count of octets transmitted
0x0015	Count of link octets retransmitted
0x0016	Count of MSUs received
0x0017	Count of octets received
0x0018	Duration of inaccessibility
0x0019	Count of MSUs discarded during routing
0x001A	Count of MSUs discarded during discrimination
0x001B	Counts of UPUs transmitted for each user part (Parameter Length=0x0040)
0x001C	Counts of UPUs received for each user part (Parameter Length=0x0040)
0x001D	Link failure reason code 0x0001 Abnormal FIBR/BSNR 0x0002 Excessive delayed ACK (T7) 0x0003 Excessive error rate 0x0004 Excessive duration of congestion (T6) 0x0005 LSSU received (SIOS, SIO, SIN, SIE) 0x0006 Changeover MSU received 0x0007 Other
0x001E	User part identifier

Information Elements

Formatted IEs with Event include IE data fields. The data included in the format depends on the IE type. The data fields for each IE type is listed below. For more information on IE field values, refer to the *CSP Developer's Guide: Common Channel Signaling*.

0x01 Call Reference

The only length that is supported is 2:

Data[0] Most Significant Byte
 Data[1] Least Significant Byte

0x02 Called Party Number

Data[0] Type of Number
 Data[1] Numbering Plan Identification
 Data[2] Number of Digits (maximum is 28)
 Data[3–N] Number Digits (IA5/ASCII)

0x03 Calling Party Number

Data[0] Type of Number
Data[1] Numbering Plan Identification
Data[2] Presentation Indicator
Data[3] Screening Indicator
Data[4] Number of Digits (maximum is 28)
Data[5–N] Number Digits (IA5/ASCII)

0x04 Called Party Subaddress

Data[0] Type of Subaddress
Data[1] Number of Digits (maximum is 28)
Data[2–N] Number Digits (IA5/ASCII)

0x05 Calling Party Subaddress

Data[0] Type of Subaddress
Data[1] Number of Digits (maximum is 28)
Data[2–N] Number Digits (IA5/ASCII)

0x06 Redirecting Number

Data[0] Number Type
Data[1] Numbering Plan
Data[2] Presentation Indicator
Data[3] Screening Indicator
Data[4] Reason for Redirection
Data[5] Number of Digits
Data[6–N] Number Digits (IA5/ASCII)

0x07 Cause

Data[0] Coding Standard
Data[1] Location
Data[2] Recommendation
Data[3] Cause Value
Data[4] Diagnostics Length
Data[5–N] Diagnostics Data

0x0A Codeset 6

Data[0] Raw IE Type
Data[1] Raw IE Length
Data[2–N] Raw IE Data
IE types are network- and protocol-specific.

0x0B Codeset 7

Data[0] Raw IE Type
Data[1] Raw IE Length
Data[2–N] Raw IE Data
IE types are network- and protocol-specific.

0x11 Codeset 5

The format for this IE is as follows:

Data[0] Raw IE Type
Data[1] Raw IE Length
Data[2–N] Raw IE Data
IE types are network- and protocol-specific.

0x12 Vari-A-Bill

Data[0] Invoke_ID (A unique identifier that specifies the feature request.)
Data[1] Billing Type (If the billing type is “Free call,” you do not need to include the billing data.)
Data[2] Hundreds
Data[3] Tens
Data[4] Ones
Data[5] Tenths
Data[6] Hundredths

Bearer Capability

You must represent this field as a Raw IE. Refer to the Q.931 specification for values.

Network-specific Facilities

You must represent this field as a Raw IE. Refer to the Q.931 specification for values.

0x13 Directory Number (DN) Provisioning

Data[0] Number of Digits in DN (n)
 Data[1] Digit 0
 Data[2] Digit 1
 :
 Data[n] Digit n
 Data[n+1] B Channel Access:
 Bit 0 Access to B1
 Bit 1 Access to B2
 Bit 2 Access to B1 and B2
 Bits 3-7 Reserved, must be 0x00

V5 Information Elements

V5 formatted IEs with Event include IE data fields. The data included in the format depends on the IE type. The data fields for each IE type are listed below. For more information on IE field values, refer to the *Developer's Guide: Common Channel Signaling*.

Cause Codes This section lists all the Cause codes included in clearing messages (*Disconnect*, *Release*, *Release Complete*) and in error messages (*Status*).

For details on the cause code values, refer to Table I.2 in the Q.931 specification.

16	Normal Call Clearing. This is used in <i>Disconnect</i> if another cause is not specified in the clear request message.
17	User Busy
30	Response to <i>Status Query</i> message.
34	No channel available. This is used in <i>Release Complete</i> for rejecting <i>Setup</i> when no channel is available. The channel is indicated as preferred in the <i>Setup</i> message.
41	Temporary failure. This is used in <i>Disconnect</i> after channel purge because the host is not responding to the clear indication.
44	Requested channel not available. This is used in <i>Release Complete</i> to reject <i>Setup</i> when the specified channel is not available. Channel is indicated as exclusive in <i>Setup</i> .
65	Bearer capability not implemented. This is used in <i>Release Complete</i> to reject a <i>Setup</i> with invalid Bearer Capability.
96	Mandatory Information Element missing. Used in <i>Release Complete</i> or <i>Status</i> message
98	Invalid message type. This is used in the <i>Status</i> message.
100	Invalid Information Element content. This is used in the <i>Status</i> message.
102	Recovery on timer expiration. This is used in <i>Release</i> or <i>Release Complete</i> after expiration of timers T305 and T308.

DASS2/DPNSS Values

This section provides data values required for DASS2/DPNSS ICBs, including the following:

- Information Elements
- Cause Codes

Information Elements DASS2/DPNSS information elements may be sorted in the IE Library using the *ISDN Interface Configure* message. You may access them with Atomic Function 95 from the PPL design document.

0x01 Service Indicator Code (SIC)

The only length that is supported is 2:

Data[0] Octet 1 of the Service Indicator Code
 Data[1] Octet 2 of the Service Indicator Code (optional)

0x02 Selection Data

Data[0–N] per BTNR 190, Section 4 for DASS2
 and BTNR 188, Section 4 for DPNSS

0x03 Indication Data

Data[0–N] per BTNR 190, Section 4 for DASS2
 and BTNR 188, Section 4 for DPNSS

Cause Codes This sections lists all the Cause codes included in clearing messages (*Disconnect, Release, Release Complete*) and in error messages (*Status*).

For details on the cause code values, refer to Table I.2 in the Q.931 specification.

DASS2

The following are DASS2 cause codes:

0	Number Unobtainable
1	Address Incomplete
2	Network Termination
3	Service Unavailable
4	Sub Incompatible
5	Sub Changed Number
6	Invalid Request for Supplementary Service
7	Congestion
8	Subscriber Engaged
9	Sub Out of Service
10	Incoming Calls Barred
11	Outgoing Calls Barred
18	Remote Procedure Error
19	Service Incompatible
20	Acknowledgment
21	Signal Not Understood
26	Message Not Understood
30	NAE Error
31	No Reply from Sub
32	Service Termination
41	Access Barred
45	DTE Controlled Not Ready
46	DTE Uncontrolled Not Ready
48	Sub Call Termination
50	ET Isolated
51	Local Procedure Error

DPNSS

The following are DPNSS cause codes:

0	Number Unobtainable
1	Address Incomplete
2	Network Termination
3	Service Unavailable
4	Subscriber Incompatible
7	Congestion
8	Busy
9	Subscriber Out of Service
10	Incoming Calls Barred
19	Service Incompatible

20	Acknowledgment
21	Signal Not Understood
22	Signal Not Valid
23	Service Temporarily Unavailable
24	Facility Not Registered
25	Reject
26	Message Not Understood
27	Signaling System Incompatible
28	Route Out of Service
29	Transferred
30	NAE (Network Address Extension) Error
35	Channel Out of Service
36	Priority Forced Release
41	Access Barred
45	DTE Controlled Not Ready
46	DTE Uncontrolled Not Ready

1

4 Tag Length Value Blocks

Overview

Purpose This chapter lists the Tag Length Value Blocks (TLVs) used in the EXS API for the CSP. The single-byte (0xNN) TLVs are first, listed in hexadecimal numerical order. They are followed by the double-byte (0xNNNN) TLVs, also listed in hexadecimal numerical order.

Introduction to TLVs

In Call Control, the TLV is used to send data to, and receive data from, the CSP within API messages.

A TLV is an internal data structure consisting of the following elements:

- Tag - a label identifying the format of the TLV
- Length - the length of the data to follow
- Value - the data

Generic TLV Format The generic format of a TLV is shown below:

Byte	Description
1	Tag (MSB)
2	Tag (LSB)
3	Length (MSB)
4	Length (LSB)
5	Value[0] (Data)
:	:
:	Value[n]

Nested TLVs The Call Agent feature and the DSP/RTP feature use nested TLVs. The following provides an overview and example of nested TLVs. An API message can contain nested TLVs. These TLVs are nested into the value field of another TLV in order to capture multiple properties of a call within one TLV.

The following applies to these nested TLVs.

- The TLV Count fields in the API message accounts for the top level TLVs but not the nested TLVs.
- The same TLV can be used multiple times within the same message depending on the context of the nested TLVs.
- The Length field in any “parent” TLV counts the bytes in all of its nested TLVs.

Example:

```

00 69 00 43 00 EA 01
00 01 0D 03 00 12 06
    00 A7
    00 20
    01
    03
    00 33
    00 53
    00 01 \Number of TLVs - top level
    29 FF 00 4D \Parent TLV
Nested TLVs [ 2A 0E 00 04 D0 D1 2B 37
Nested TLVs [ 2A 01 00 41 \Length includes all nested TLVs
Nested TLVs [ 2A 03 00 01 00
Nested TLVs [ 2A 07 00 04 00 00 13 98
Nested TLVs [ 2A 0A 00 02 00 14
Nested TLVs [ 2A 02 00 13 \Length includes next 3 TLVs
Nested TLVs [ 2A 08 00 02 00 02
Nested TLVs [ 2A 09 00 01 02
Nested TLVs [ 2A 0B 00 04 00 00 1F 40
Nested TLVs [ 2A 02 00 13 \Length includes next 3 TLVs
Nested TLVs [ 2A 08 00 02 01 65
Nested TLVs [ 2A 09 00 01 32
Nested TLVs [ 2A 0B 00 04 00 00 1F 40
    
```

Interworking TLVs This chapter contains TLVs used for Interworking and are indicated as such. Some of these Interworking TLVs can also be used in Standard environments and that is indicated as well.

Refer to *Interworking in the Developer's Guide: Internet Protocol*.

Interworking TLVs are used in the following API messages:

Host to CSP

- *Outseize Control*
- *Route Control*
- *Inseize Control*
- *Connect with Data*
- *Release Channel with Data*
- *Outputpulse Digits*
- *PPL Event Request*

CSP to Host

- *Request for Service with Data*
- *Channel Released with Data*
- *PPL Event Indication*
- *Channel Release Request*

TLVs

0x01 Trunk Number

Used in:

SS7 CLLI Configure message

Byte	Description
0	Tag 0x01
1	Length 0x04
2-5	Value[0-3] Trunk Number (IA5/ASCII characters)

0x01 Module, IP Address, and Subnet Mask

Use this TLV to configure the IP Address of a VoIP module.

In this TLV block, the module value (Data[0]) must change to reflect the IP address of the VoIP Module assigned. When IP addresses are re-assigned, the TCP/IP stack must be re-initialized. To ensure that the stack is re-initialized properly, you must reboot the board or module, using one of the following TLVs:

- Engage IP (0x02): If the Engage IP TLV is assigned, reset is automatic
- Reset (0x03)

Used in:

IP Address Configure message

IP Address Query message

Byte	Description
0	Tag 0x01 Module, IP Address, Subnet Mask
1	Length 0x09
2	Value[0] 0xFF (Main Board) 0x00 (VoIP Module 1) 0x01 (VoIP Module 2) 0x02 (VoIP Module 3) 0x03 (VoIP Module 4)
3-6	Value[1-4] IP Address (4 bytes)
7-10	Value[5-8] Subnet Mask (4 bytes)

0x01 Add Virtual Card

Used in:

Virtual Card Configure message

Byte	Description
0	Tag 0x01 Add Virtual Card
1	Length 0x02
2	Value[0] Slot Number 0x40- 0x5F
3	Value[1] Card Type 0xD2 Virtual T1 16 Span 0xD5 Virtual E1/J1 16 Span 0x80 Virtual 32 Span VDAC-ONE or IP Media Series 2

0x01 Client Socket Register by IP

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x01 Client Socket Register by IP
1	Length 0x0E
2	Value[0] 0x00 Module (0xFF = base board)
3	Value[1] Socket ID
4-7	Value[2-5] Local IP Address (4 bytes)
8, 9	Value[6, 7] Local Port
10-13	Value[8-11] Remote IP Address (4 bytes)
14, 15	Value[12, 13] Remote Port

0x02 Remove Virtual Card

Used in:

Virtual Card Configure message

Byte	Description
0	Tag 0x02 Remove Virtual Card
1	Length 0x01
2	Value[0] Slot Number 0x00- 0x0F

0x02 Server Socket Register by IP

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x02 Server Socket Register by IP
1	Length 0x0E
2	Value[0] (0x00) Module (0xFF = base board)
3	Value[1] Socket ID
4-7	Value[2-5] Local IP Address (4 bytes)
8, 9	Value[6, 7] Local Port
10-13	Value[8-11] Remote IP Address (4 bytes)
14, 15	Value[12, 13] Remote Port

0x02 Local CLLI

Used in:

SS7 CLLI Configure

Byte	Description
0	Tag 0x02
1	Length 0x0B
2-12	Value[0-10] Local CLLI (IA5/ASCII characters)

0x02 Engage IP

Used In:

IP Address Configure

Byte	Description
0	Tag 0x02 Engage IP
1	Length 0x00
2	Value Does Not Apply

0x03 Reset IP

Used In:

IP Address Configure

Byte	Description
0	Tag 0x03 Reset
1	Length 0x00
2	Value Does Not Apply

0x03 Client Socket Register by Name

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x03 Client Socket Register by Name
1	Length 0x00D
2	Value[0] 0x00 Module (0xFF = base board)
3	Value[1] Socket ID
4-7	Value[2-5] Local IP Address (4 bytes)
8	Value[6] Local Port, MSB
9	Value[7] Local Port, LSB
10	Value[8] Remote Name Length
11	Value[9] Remote Name[0]
12	Value[10] Remote Name[1]
13	Value[:] :
14	Value[:] Remote Port, MSB
15	Value[:] Remote Port, LSB

0x03 Remote CLLI

Used in:

SS7 CLLI Configure message*SS7 CLLI Query* message

Byte	Description
0	Tag 0x03
1	Length 0x0B
2-12	Value[0-10] Remote CLLI (IA5/ASCII characters)

0x04 Trunk Type

Used in:

SS7 CLLI Configure message*SS7 CLLI Query* message

Byte	Description
0	Tag 0x04
1	Length 0x01
2	Value[0] Trunk Type 0x00 Incoming One-way 0x01 Outgoing One-way 0x02 Two-way (default)

0x04 Server Socket Register by Name

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x04 Server Socket Register by Name
1	Length Variable
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID
4-7	Value[2-5] Local IP Address (4 bytes)
8, 9	Value[6, 7] Local Port
10	Value[8] Remote Name Length
11	Value[9] Remote Name[0]
12	Value[10] Remote Name[1]
13	Value[:]
:	Value[:] Remote Port
:	Value[:] Remote Port

0x04 Reset Indicator

At any time, the host can send a *Reset Configuration* message to the card to ensure that the IP address is assigned. The reset indicator value is returned in the Reset Indicator TLV. If the host sends a Reset or Engage TLV, an ACK is returned with all Indicator bits set to 0. If neither the Reset nor the Engage TLV is sent, the bit mask applies.

Used in:

IP Address Configure message

Byte	Description
0	Tag 0x04 Reset Indicator
1	Length 0x04
2	Value[0] 0x00 Reset Indicator, MSB
3	Value[1] Reset Indicator
4	Value[2] Reset Indicator
5	Value[3] Reset Indicator, LSB (0 = Disable, 1 = Enable) Bit 0: Main Board Bit 1: VoIP Module 1 Bit 2: VoIP Module 2 Bit 3: VoIP Module 3 Bit 4: VoIP Module 4 Bit 5: Reserved (0x00) Bit 6: Reserved (0x00) Bit 7: Reserved (0x00)

0x05 Gateway IP

The host can assign Gateway IP addresses the following ways:

- to the main board alone
- to the main board and all modules together
- to individual modules

If the first data byte of the Gateway IP TLV specifies the main board and all modules together (0x05), then the message must have a TLV block for the main board and for each module, specifying their individual IP addresses and subnet masks.

Important! Data byte 0x05 cannot be used in conjunction with 2 module VDAC-ONE or IP Network Interface Series 2 cards. For a two module VDAC-ONE or IP Network Interface Series 2 card, you must assign the gateway address with each individual module IP address.

Used in:

- *IP Address Configure* message
- *IP Address Query* message

Byte	Description
0	Tag 0x05 Gateway IP
1	Length 0x05
2	Value[0] 0xFF Main Board 0x00 VoIP Module 1 0x01 VoIP Module 2 0x02 VoIP Module 3 0x03 VoIP Module 4 0x05 All Modules, including Main Board
3-6	Value[1-4] IP Address (4 bytes)

0x05 Unregister Socket

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x05 Unregister Socket
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x06 Open Socket

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x06 Open Socket
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x07 Close Socket

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x07 Close Socket
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x08 Prohibit Traffic on Socket

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x08 Prohibit Traffic on Socket
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x09 Allow Traffic on Socket

Used in:

IP Socket Configure message

Byte	Description
0	Tag 0x09 Allow Traffic on Socket
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x09 Ethernet Link Redundancy

Use this TLV to enable Ethernet Link Redundancy. If you enable Ethernet Link Redundancy, the lower Ethernet Port is automatically activated. Note that Ethernet Link Redundancy is not supported on the SS7 Series 3 card.

Used in:

IP Address Configure message

IP Address Query message

Byte	Description
0	Tag 0x09 Ethernet Link Redundancy
1	Length 0x04
2-5	Value[0-3] 0x00000000 Disable 0x00000001 Enable

0x09 Ethernet Link Redundancy (DSP Series 2 Card)

Use this TLV to enable Ethernet Link Redundancy. If you enable Ethernet Link Redundancy, the upper Ethernet port is automatically activated.

Used in:

IP Address Configure message

IP Address Query message

Byte	Description
0	Tag 0x09 Ethernet Link Redundancy
1	Length 0x04
2-5	Value[0] 0x00000000 Disable 0x00000001 Enable

0x0A Activate Ethernet Port

Use this TLV to assign the active Ethernet Port on a VDAC-ONE card. The upper port is active by default. To activate the lower port, you must send this TLV. Note that Ethernet Link Redundancy is not supported on the SS7 Series 3 card.

Important! If you enable Ethernet Link Redundancy (TLV 0x09), the standby Ethernet Port is automatically activated upon failure of the active port.

This TLV also activates the Ethernet Interface of the Maxtrix Controller I/O as follows:

- Activate the Upper Port for Ethernet Interface B.
- Active the Lower Port for Ethernet Interface A.

Used in:

IP Address Configure message

IP Address Query message

Byte	Description
0	Tag 0x0A Activate Ethernet Port
1	Length 0x04
2	Value[0] 0x00000000 Upper Port Active 0x00000001 Lower Port Active

Important! The two TLVs above (0x09 and 0x0A) are returned in the response to a successful *IP Address Query* message.

0x0A Activate Ethernet Port (DSP Series 2 Card)

Use this TLV to assign the active Ethernet port for a DSP Series 2 card. If you enable Ethernet Link Redundancy (TLV 0x09), an available standby Ethernet Port is automatically activated upon failure of the active port. This TLV activates the Ethernet Interfaces on the Multi-Function Media I/O card as follows:

- Upper port (NET1)
- Middle port (NET2)
- Lower port (NET3)

Used in:

IP Address Configure message

IP Address Query message

Byte	Description
0	Tag 0x0A Activate Ethernet Port
1	Length 0x04
2-5	Value[0] 0x00000001 Upper Port Active (NET1) 0x00000002 Middle Port Active (NET2) 0x00000003 Lower Port Active (NET3)

The two TLVs above (0x09 and 0x0A) are returned in the response to a successful *IP Address Query* message. If an 0x00FF is returned as the value of the Active Ethernet Port TLV (0x0A) in the response

to a *IP Address Query* message, it indicates that Ethernet Link Redundancy is disabled.

0x0A Socket Status

Used in:

IP Socket Status Report message

Byte	Description
0	Tag 0x0A Socket Status
1	Length 0x03
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] 0x01-0x02 Socket ID
4	Value[2] Socket Status 0x00 Socket is not connected, but allow for traffic when connected 0x01 Socket is connected. Allow for Traffic 0x02 Socket is not connected. Prohibit Traffic.

0x0B Socket ID

Used in:

0x00F1 *IP Socket Query* message

Byte	Description
0	Tag 0x0B Socket ID
1	Length 0x02
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID

0x0C Socket Information

Used in:

0x00F1 *IP Socket Query* message

Byte	Description
0	Tag 0x0C Socket Information
1	Length 0x014
2	Value[0] 0x00 Module (0xFF = Main Board)
3	Value[1] Socket ID
4	Value[2] Socket Status
5	Value[3] Socket Client Flag 0x00 Server Side Socket 0x01 Client Side Socket
6-9	Value[4-7] Local IP Address (4 bytes)
10, 11	Value[8, 9] Local Port
12-15	Value[10-13] Remote IP Address (4 bytes)
16, 17	Value[14, 15] Remote Port
18-21	Value[16-19] Socket User Name SASI Socket user is SASSI LHST Socket user is Local host communication module 0X00 00 00 00 Socket is not binded to any user

0x11 Signaling Route Test Control Status

Used in:

0x1E and 0x001E Generic PPL ICBs in *PPL Event Request* message

Byte	Description
0	Tag SRTC Status
1	Length 0x01
2	Value[0] 0x11

0x12 Signaling Route Test Control DPC

Used in:

0x1E and 0x001E Generic PPL ICBs in *PPL Event Request* message

Byte	Description
0	Tag 0x12 Signaling Route Test Control DPC
1	Length 0x01
2	Value[0] 0x02

0x14 Reset VDAC Module

Used in:

IP Address Configure message

Byte	Description
0	Tag 0x14
1	Length 0x01
2	Value[0] Module VDAC-ONE 0-3 IPN-2 0-1

0x6F L3 IP Protocol Type

Used in:

PPL Configure message

Byte	Description
0, 1	Tag 0x006F
2, 3	Length 0x0001
4	Value[0] 0x08 SIP 0x09 H.323

0x0001 Add IP Signaling Series 3 Card

Used in:

Matrix Configure message (0x7D)*IP Signaling Series 3 Card Configure* message (0x0100)

Byte	Description
0, 1	Tag 0x0001
2, 3	Length 0x0002
4	Value[0] IP Signaling Series 3 Card ID, MSB0x00
5	Value[1] IP Signaling Series 3 Card ID, LSB0x00-0x3F

0x0001 Create V5 ID

Used in:

V5 Configure message*V5 Configuration Query* message

Byte	Description
0	Tag 0x00 Create V5 ID (MSB)
1	Tag 0x01 Create V5 ID (LSB)
2	Length 0x00 (MSB)
3	Length 0x02 (LSB)
4	V5 ID 0x00 (MSB)
5	V5 ID 0x00 - 0x0F (LSB)

0x0002 Destroy V5 ID

Used in:

V5 Configure message

Byte	Description
0	Tag 0x00 Destroy V5 ID (MSB)
1	Tag 0x02 Destroy V5 ID (LSB)
2	Length 0x00 (MSB)
3	Length 0x00 (LSB)

0x0002 Remove IP Signaling Series 3 Card

Used in:

Matrix Configure message (0x7D)*IP Signaling Series 3 Card Configure* message (0x0100)

Byte	Description
0, 1	Tag 0x0002
2, 3	Length 0x0002
4	Value[0] IP Signaling Series 3 card ID to be removed, MSB: 0x00 Remove a specific IP Signaling Series 3 card 0xFF Remove every configured IP Signaling Series 3 cards
3	Value[1] IP Signaling Series 3 card ID to be removed, LSB: 0x00-0x3F IP Signaling Series 3 card to be removed 0xFF Remove all configured IP Signaling Series 3 cards

0x0003 Matrix ID

Used in:

IP Signaling Series 3 Card Configure message*IP Signaling Series 3 Card Query* message

Byte	Description
0, 1	Tag 0x0003
2, 3	Length 0x0002
4	Value[1] Matrix ID, MSB 0x00
5	Value[2] Matrix ID, LSB 0x00 - 0x3F

0x0003 Protocol Type

Used in:

Matrix Configure message (0x007D)*Matrix Query* message (0x0097)*Server Configuration* message (0x0100)*Matrix Status Report* message (0xE5)

Byte	Description
0, 1	Tag 0x0003
2, 3	Length 0x0004
4	Value[0] Protocol, MSB 0x00
5	Value[1] Protocol, LSB 0x01 H.323
6	Value[2] Platform, MSB 0x00
7	Value[3] Platform, LSB 0x00 CSP 0x01 Solaris 0x02 Windows NT® 0x03 HPUX

0x0003 V5 Variant ID

Used in:

V5 Configure message*V5 Configuration Query* message

Byte	Description
0	Tag 0x00 V5 Variant ID (MSB)
1	Tag 0x03 V5 Variant ID (LSB)
2	Length 0x00 (MSB)
3	Length 0x01 (LSB)
4	Value[0-127] 0x00 V5 Variant ID Value

0x0004 V5 Variant Type

Used in:

V5 Configure message*V5 Configuration Query* message

Byte	Description
0	Tag 0x00 V5 Variant Type (MSB)
1	Tag 0x04 V5 Variant Type (LSB)
2	Length 0x00 (MSB)
3	Length 0x01 (LSB)
4	Variant Type 0x01 0x02 = V5.2 (default)

0x0004 Remove Matrix

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

Byte	Description
0, 1	Tag 0x0004
2, 3	Length 0x0002
4	Value[0] Call Server ID to be removed, MSB 0x00 To remove a specific Matrix 0xFF To remove all configured Matrices
5	Value[1] Call Server ID to be removed, LSB 0x00-0x3F To remove a specific Matrix 0xFF To remove all configured Call Matrices

0x0004 Configuration Tag

Used in:

Matrix Configure message (0x007D)*Matrix Query* message (0x0097)

Byte	Description
0, 1	Tag 0x0004
2, 3	Length 0x0002
4, 5	Value[0-1] Configuration Tag 0 - 0xFFFF

0x0005 IP Signaling Series 3 Card IP Address

Used in:

Matrix Configure message (0x007D)

Matrix Query message (0x0097)

Byte	Description
0, 1	Tag 0x0005
2, 3	Length 0x0006
4-7	Value[0-3] IP Address (4 bytes)
8, 9	Value[4, 5] Port Number (Variable)

0x0005 IP Signaling Series 3 Card Slot Number

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

IP Signaling Series 3 Card Query message (0x0101)

Byte	Description
0, 1	Tag 0x0005
2, 3	Length 0x0002
4	Value[0] IP Signaling Series 3 Card Slot Number, MSB 0x00
5	Value[1] IP Signaling Series 3 Card Slot Number, LSB 0x00-0x0F

0x0005 V5 Side

Used in:

V5 Configure message

V5 Configuration Query message

Byte	Description
0	Tag 0x00 V5 LE or AN Side (MSB)
1	Tag 0x05 V5 LE or AN Side (LSB)
2	Length 0x00 (MSB)
3	Length 0x01 (LSB)
4	LE or AN 0x00 = LE (default) 0x01 = AN (AN not supported)

0x0006 Route Group ID

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x0006
2, 3	Length 0x0002
4, 5	Value[0-1] Route Group ID or 0x0000 Null

0x0006 Add V5 User Port Range

Used in:

V5 Configure message

V5 Configuration Query message

Byte	Description
0	Tag 0x00 Add V5.2 User Port Range (MSB)
1	Tag 0x06 Add V5.2 User Port Range (LSB)
2	Length 0x00 (MSB)
3	Length 0xNN (LSB)
4	Number of Ranges
5	User Port Type
6	Start User Port ID, MSB
7	Start User Port ID, LSB
8	End User Port ID, MSB
9	End User Port ID, LSB
:	:
:	Start User Port ID, MSB
:	Start User Port ID, LSB
:	End User Port ID, MSB
:	End User Port ID, LSB
:	:

0x0007 Remove V5 User Port Range

Used in:
V5 Configure message

Byte	Description
0	Tag 0x00 Remove V5.2 User Port Range (MSB)
1	Tag 0x07 Remove V5.2 User Port Range (MSB)
2	Length 0x00 (MSB)
3	Length 0xNN (LSB)
4	Number of Ranges
5	User Port Type
6	Start User Port ID, MSB
7	Start User Port ID, LSB
8	End User Port ID, MSB
9	End User Port ID, LSB
:	:
:	Start User Port ID, MSB
:	Start User Port ID, LSB
:	End User Port ID, MSB
:	End User Port ID, LSB
:	:

0x0007 IP Signaling Series 3 Card Service State

Used in:
Matrix Configure message (0x007D)

Byte	Description
0, 1	Tag 0x0007
2, 3	Length 0x0002
4	Service, MSB 0x00
5	Service, LSB 0x00 Out of Service 0x01 In Service

0x0007 Incoming Span/Channel, Single Address

Used in:
PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0007
2, 3	Length 0x0006
4, 5	Value[0,1] Span

Byte	Description
6	Value[2] Channel
7-9	Value[3-5] Mask

0x0007 Incoming Span/Channel, Range Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0007
2, 3	Length 0x0009
4, 5	Value[0,1] Span
6	Value[2] Channel
7, 8	Value[3,4] To Span
9	Value[5] To Channel
10-12	Value[6-8] Mask

0x0008 IP Signaling Series 3 Card Compatibility Tag

Used in:

Matrix Configure message (0x7D)

IP Signaling Series 3 Card Query message (0x0101)

IP Signaling Series 3 Card Configure message (0x0100)

Byte	Description
0, 1	Tag 0x0008
2, 3	Length 0x0002
4	Value[0] Value set up on both sides of the interface, MSB 0x00-0xFF
5	Value[1] Value set on both sides of the interface, LSB 0x00 - 0xFF

0x0008 Criteria Type

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

0x1E and 0x001E Generic PPL ICBs in *Route Control* message

Byte	Description
0, 1	Tag 0x0008 Criteria Type
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0000 Null 0x0001 - 0004 Address Digits 1, 2, 3, 4 0x0005 Time of day 0x0007 Incoming Channel 0x0010 Incoming Resource Group 0x001A Incoming Node 0x0065 Physical VoIP Channel 0x0071 Virtual VoIP Channel 0x03E9 - 03F8 User Defined 0x2710 - 0x4E20 Universal Protocol Data 0x2792 Source IP Address 0x27B4 IP Address Criteria 0x2A0E Media Connection Address

0x0009 Address Element TLV

Important! In the Address Element TLV, the *Resource Attribute Configure* message requires either the Expanded Span Channel AIB or the IP Address AIB, but not both. The Address Element Blocks TLV that follows can refer to either the Expanded Span/Channel AIB or to the IP Address AIB.

For Expanded Span/Channel AIB:

Use this TLV to address configuration to a specific channel. If you are changing the attributes of an existing connection, use the Channel address type (0x0D).

Used in:
Resource Attribute Configure message

Byte	Description
0, 1	Tag: Address Element (0x0009)
2, 3	Length: 0x0005
4	Value[0] AIB Type: 0x0D (Expanded Span/Channel)
5	Value[1] AIB Length (0x03)
6	Value[2] Logical Span (MSB)
7	Value[3] Logical Span (LSB)
8	Value[4] Channel

For IP Address AIB:

Use this TLV to address configuration to a specific VoIP module.

Important! This TLV is required for all attribute configuration except for Gateway Mode (Gateway Mode TLV, 0x01D0), which configures an entire IP Network Interface Series 2 card.

If you are pre-configuring the attributes on a VoIP module, use the IP Address type (0x3E).

Used in:

Resource Attribute Configure message

Byte	Description
0, 1	Tag: Address Element (0x0009)
2, 3	Length: 0x0006
4	Value: Data[0] AIB Type: 0x3E (IP Address)
5	Value: Data[1] AIB Length 0x04
6-9	Value: Data[2-5] IP Address (4 bytes)

0x0009 Poll Interval

The poll interval, which is in 10 milliseconds units, should be configured with values greater than 5. If configured with anything less than 5, the IP Signaling Series 3 card will automatically set the poll interval to 5.

Important! This poll is the Matrix to IP Signaling Series 3 card poll not the IP Signaling Series 3 card to Host poll.

Used in:
Matrix Configure message (0x7D)

Byte	Description
0, 1	Tag 0x0009
2, 3	Length 0x0004
4, 5	Value[0-1] Number of Seconds Between Polls 0x00 - 0xFF In 10 milliseconds units
6, 7	Value[2-3] Number of Missed Polls Before Link is Declared Down 0x00 - 0xFF

0x0009 Terminating Channel

Use this TLV to specify a destination channel or a node. This TLV is used for the Terminating Channel routing method. The span/channel or node are specified in the TLV in an Address Information Block (AIB).

Used in:
 0x001E or 0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x0009 Terminating Channel or Node
2, 3	Length 0x0005
4	Value[0] AIB Type: 0x0D
5	Value[1] AIB Length (0x03)
6	Value[2] Logical Span (MSB)
7	Value[3] Logical Span (LSB)
8	Value[4] Channel

0x0009 Terminating Span/Channel, Single Address

Used in:
PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0009
2, 3	Length 0x0006
4, 5	Value[0,1] Span
6	Value[2] Channel
7-9	Value[3-5] Mask

0x0009 Terminating Span/Channel, Range Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0009
2, 3	Length 0x0009
4, 5	Value[0,1] Span
6	Value[2] Channel
7, 8	Value[3,4] To Span
9	Value[5] To Channel
10-12	Value[6-8] Mask

0x000A Matrix IP Address

Used in:

*Matrix Configure message (0x007D)**Matrix Query message (0x0097)*

Byte	Description
0, 1	Tag 0x000A
2, 3	Length 0x0006
4-7	Value[0-3] IP Address (4 bytes)
8, 9	Value[4-5] Port Number

0x000A Add Poll Interval

The poll interval, which is in 10 milliseconds, should be configured with values greater than 5. If configured with anything less than 5, the IP Signaling Series 3 card will automatically set the poll interval to 5.

Important! This poll is the IP Signaling Series 3 card to Matrix poll not the IP Signaling Series 3 card to Host poll.

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

IP Signaling Series 3 Card Query message (0x0101)

Byte	Description
0, 1	Tag 0x000A
2, 3	Length 0x0004
4, 5	Value[0-1] Number of Seconds Between Polls 0x00 - 0xFF In 10 millisecond units
6, 7	Value[2-3] Number of Missed Polls Before Link is Declared Down 0x00 - 0xFF

0x000A V5 C Channel Assignment

Used in:

V5 Configure message

V5 Configuration Query message

Byte	Description
0	Tag 0x00 V5 C Channel Assignment (MSB)
1	Tag 0x0A V5 C Channel Assignment (LSB)
2	Length 0x00 (MSB)
3	Length 0x06 (LSB)
4	Type 0x01 = PG1 Primary 0x02 = PG1 Secondary 0x03 = PG#2 (Not Supported)
5	Logical Span ID for Primary Link, MSB
6	Logical Span ID for Primary Link, LSB
7	Primary Physical Channel 16
8	V5 C Channel ID 0x00 = Primary 0x01 - 0x2B = Others
	Link ID

0x000B V5 Cpath Assignment

Used in:

V5 Configure message

V5 Configuration Query message

This TLV is currently not supported.

Byte	Description
0	Tag 0x00 V5 Cpath Assignment (MSB)
1	Tag 0x0B V5 Cpath Assignment (LSB)
2	Length 0x00 (MSB)
3	Length 0x02 (LSB)
4	C Channel ID
5	Cpath Type 0x00 = PSTN

Before adding a C path you must create a C Channel and the C Channel should belong to Protection Group 2. Protection Group 2 is not supported.

0x000B IP Signaling Series 3 Card Version

Used in:

Matrix Configure message (0x007D)

Matrix Status Report message

Matrix Query message (0x0097)

Byte	Description
0, 1	Tag 0x000B
2, 3	Length 0x0006
4, 5	Major Revision Variable
6, 7	Minor Revision Variable
8, 9	Build Number Variable

0x000C Matrix IP Address

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

IP Signaling Series 3 Card Query message (0x0101)

Byte	Description
0, 1	Tag 0x000C
2, 3	Length 0x0006
4-7	Value[0-3] IP Address (4 Bytes)
8, 9	Value[4, 5] Port Number

0x000C V5 Add Link

Used in:

V5 Configure message*V5 Configuration Query* message

Byte	Description
0	Tag 0x00 V5 Add Link (MSB)
1	Tag 0x0C V5 Add Link (LSB)
2	Length 0x00 (MSB)
3	Length 0x04 (LSB)
4	Logical Span ID for Link, MSB 0x00
5	Logical Span ID for Link, LSB 0x00
6	V5 Link ID (0 - 15) 0x00
7	Real V5 Link ID (0 - 255) 0x00

0x000D V5 Remove Link

Used in:

V5 Configure message

Byte	Description
0	Tag 0x00 V5 Remove Link (MSB)
1	Tag 0x0D V5 Remove Link (LSB)
2	Length 0x00 (MSB)
3	Length 0x01 (LSB)
4	V5 Link ID 0x00 - 0x0F

0x000E Terminating Span/Channel Offset

Used in:

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x000E Terminating Span/Channel Offset
2, 3	Length 0x0003
4	Value[0] Offset

0x000E IP Signaling Series 3 Card Interface Service State

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

IP Signaling Series 3 Card Query message (0x0101)

Byte	Description
0, 1	Tag 0x000E
2, 3	Length 0x0002
4	Value[0] State, MSB 0x00
5	Value[1] State, LSB 0x00 Out of Service 0x01 In Service

0x000F IP Signaling Series 3 Card Interface Support

Used in:

IP Signaling Series 3 Card Configure message (0x0100)

Byte	Description
0, 1	Tag 0x000F
2, 3	Length 0x0010
4	Value[0] L3/L4 Signaling Interface, MSB 0x00
5	Value[1] L3/L4 Signaling Interface, LSB 0x00 Disable 0x01 Enable
6	Value[2] LX/ENG Connection Interface, MSB 0x00
7	Value[3] LX/ENG Connection Interface, LSB 0x00 Disable 0x01 Enable
8-20	Value[4-16] Reserved 0x00 (Disabled)

0x000F Router Protocol ID

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

0x1E and 0x001E Generic PPL ICBs in *Route Control* message

Byte	Description
0, 1	Tag 0x000F Router Protocol ID
2, 3	Length 0x0001
4	Value[0] Router Protocol ID 0x0B (default)

0x000F V5 Remove C Channel Assignment

Used in:

V5 Configure message

Byte	Description
0	Tag 0x00 V5 Remove C Channel Assignment (MSB)
1	Tag 0x0F V5 Remove C Channel Assignment (LSB)
2	Length 0x00 (MSB)
3	Length 0x01 (LSB)
4	V5 C Channel ID 0x00 = Primary 0x01 - 0x2B = Others

0x000F Link Down Timer

This timer is used when the link between the IP Signaling Series 3 Card and the CSP Matrix Series 3 Card goes down. If there is a secondary CSP Matrix Series 3 Card present in the node, the IP Signaling Series 3 card triggers this timer and does not release any active calls (calls in the answered state). The IP Signaling Series 3 card waits until the timer expires to re-establish the connection with the secondary matrix.

If the connection is re-established, all the active calls stay connected; however, no new calls (incoming or outgoing) can be made when the link between the CSP Matrix Series 3 Card and IP Signaling Series 3 card is temporarily down.

If the link is not re-established or if there is no secondary CSP Matrix Series 3 Card in the node, all of the active calls are released on the H.323 (IP) end.

Used in:

IP Signaling Series 3 Card Configure message*IP Signaling Series 3 Card Query* message

Byte	Description
0, 1	Tag Link Down Timer
2, 3	Length 0x02
4, 5	Value[0, 1] Timer in 10 ms intervals (MSB, LSB). 0x2EE0 (Default is 12000 seconds - 2 minutes)

0x0010 Incoming Resource Group

Used in:

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x0010 Incoming Resource Group
2, 3	Length 0x0002
4, 5	Value[0, 1] Incoming Resource Group ID [MSB, LSB]

0x0010 V5 Interface ID

The V5 Interface ID is the actual ID used in the network.

Used in:

V5 Configure message

V5 Configuration Query message

Byte	Description
0, 1	Tag 0x0010 V5 Interface ID (actual ID used in the network)
2, 3	Length 0x0003
4	V5 Interface ID, MSB 0x00
5	V5 Interface 0x00
6	V5 Interface ID, LSB 0x00

0x0010 Incoming Res Group ID, Single Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0010
2, 3	Length 0x0004
4, 5	Value[0,1] Node
6, 7	Value[2,3] Mask

0x0010 Incoming Res Group ID, Range Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0010
2, 3	Length 0x0006

Byte	Description
4, 5	Value[0,1] From Node
6, 7	Value[2,3] To Node
8, 9	Value[4,5] Mask

0x0012 Remove V5 Cpath Assignment

Used in:

V5 Configure message

This TLV is not currently supported.

Byte	Description
0, 1	Tag 0x0012 Remove V5 C path Assignment
2, 3	Length 0x0001
4	C Channel ID 0x01 = V5 ID 0x03 = C Channel ID

0x0013 Routing Method

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

0x1E and 0x001E Generic PPL ICBs *Route Control* message

Byte	Description
0, 1	Tag 0x0013 Routing Method
2, 3	Length 0x0002
4, 5	Value[0-1] 0x0000 Null 0x0006 Route Group ID 0x0008 Criteria Type 0x0009 Terminating Channel 0x0010 Incoming Resource Group 0x0015 Terminating Resource Group 0x000E Terminating Span/Channel Offset 0x001A Incoming Node

0x0014 Message Header Information

Used in:

PPL Event Indication message

Byte	Description
0, 1	Tag 0x0014
2, 3	Length 0x0004
4, 5	Value[0-1] Contains the message type 0x00D8 - Route Control or 0x002C - Outsize Control
5,6	Value[2-3] Contains the two-byte sequence number of the Route Control /Outsize Control message sent by the host. The valid values ranges from 0x0000-0xFFFF.

0x0015 Terminating Resource Group

Used in:

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x0015 Terminating Resource Group
2, 3	Length 0x0002
4, 5	Value[0-1] Resource Group ID [MSB, LSB]

0x0015 Terminating Resource Group ID, Single Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0015
2, 3	Length 0x0004
4, 5	Value[0,1] Node
6, 7	Value[2,3] Mask

0x0015 Terminating Resource Group ID, Range Address

Used in:

PPL Table Download (0x00D6)

Byte	Description
0, 1	Tag 0x0015
2, 3	Length 0x0006
4, 5	Value[0,1] From Node
6, 7	Value[2,3] To Node
8, 9	Value[4,5] Mask

0x001A Incoming Node

Used in:

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x001A Incoming Node
2, 3	Length 0x01
4, 5	Value[0, 1] Node ID

0x001D Special Routing Instruction

Byte	Description
0, 1	Tag 0x001D Special Routing Instruction
2, 3	Length 0x02
4, 5	Value[0, 1] 0x0003 Channel Reservation

0x0020 IP Signaling Series 3 Card Interface Status

Used in:

IP Signaling Series 3 Card Status Report message (0x0105)

Byte	Description
0, 1	Tag 0x0020
2, 3	Length 0x0004
4	Value[0] DSM FSM State Values, MSB 0x00
5	Value[1] DSM FSM State Values, LSB 0xFF FSM uninitialized 0x01 FSM initialized 0x02 FSM waiting for socket accessible indication 0x03 FSM waiting for socket inaccessible indication 0x04 FSM waiting for status request from the call server 0x05 FSM waiting for channel status request from the call server 0x06 FSM active 0x07 FSM inactive
6	Value[2] Call Server Values, MSB 0x00
7	Value[3] Call Server Values, LSB 0x01 Call server socket inaccessible 0x02 Call server socket accessible 0x03 Call server open failed 0x04 Call server close failed 0x05 Call server link down

0x0021 IP Signaling Series 3 Card Host Poll

Used in:

IP Signaling Series 3 Card Host Poll message (0x0104)

Byte	Description
0, 1	Tag 0x0021
2, 3	Length 0x0009
4, 5	Value[0, 1] IP Signaling Series 3 Card Status 0x0010
6	Value[2] System Type 0x10 IP Signaling Series 3 Card
7	Value[3] IP Signaling Series 3 Card Type 0x01 H.323 IP Signaling Series 3 Card
8	Value[4] IP Signaling Series 3 Card State 0x01 Booting 0x02 Initializing 0x03 Standby 0x04 Not used 0x05 Active
9	Value[5] Reserved
10	Value[6] IP Signaling Series 3 Card Status Bits Bit 0 Host Messaging 0x00 OK 0x01 Not receiving messages Bits 1 through 7 - not used
11, 12	Value[7, 8] Reserved

0x0051 Dialog Terminated

Used in:

SS7 TCAP Parameters ICB in PPL Event Indication

Byte	Description
0, 1	Tag 0x0051
2, 3	Length 0x0001
4	Value[0] Dialog Terminated

0x005E Resource Client ID

Used in:
Route Control message

Byte	Description
0, 1	Tag 0x005E
2, 3	Length 0x0008
4,5	Value[0, 1] Alias ID (MSB, LSB) 0x0002 = V5 Client
6,7	Value[2,3] Reserved
8-11	Value[4-7] Client ID: V5 ID

0x0061 Reject Reason

Used in:
PPL Event Indication message

Byte	Description
0, 1	Tag 0x0060
2, 3	Length 0x0002
4, 5	Value[0, 1] Reject Reason 0x02 Admission Reject (ARJ) Indication 00 01 Called Party Not Registered 00 02 Invalid Permission 00 03 Request Denied 00 04 Undefined Reason 00 05 Caller Not Registered 00 06 Route Call To Gatekeeper 00 07 Invalid Endpoint Identifier 00 08 Resource Unavailable 00 09 Security Denial 00 0A QOS Control Not Supported 00 0B Incomplete Address 0x05 Bandwidth Reject (BRJ) Indication 00 01 Not Bound 00 02 Invalid Conference ID 00 03 Invalid Permission 00 04 Insufficient Resources 00 05 Invalid Revision 00 06 Undefined Reason

0x0062 Resource Group Reorder Method

Byte	Description
0, 1	Tag 0x0062
2, 3	Length 0x0001
4	Value[0] 0x01 - Round Robin 0x02 - Least Recently Used (LRU)

0x0063 Route Number

Byte	Description
0, 1	Tag 0x0063
2, 3	Length 0x0003
4	Value[0] 0x01 - Route Table ID
5,6	Value[1,2] Route Number

0x0065 Physical VoIP Channel

Indicates to the router to hunt a physical VoIP channel.

Used in:

PPL Table Download message

0x1E Generic PPL ICB in *Route Control* message

Byte	Description
0, 1	Tag 0x0065
2, 3	Length 0x0002
4,5	Value[0-1] 0x0000

0x006D SCCP Return Reason

Used in:

PPL Event Indication message

Byte	Description
0, 1	Tag 0x006D
2, 3	Length 0x0001
4	Value[0] Reason Number 0x00 Translation does not exist 0x03 Subsystem failure 0x04 Unequipped user 0x05 MTP failure 0x06 Network congestion

0x0071 Virtual VoIP Channel

Indicates to the router that a virtual VoIP channel will be hunted.

Used in:

PPL Table Download message

0x1E and 0x001E Generic PPL ICBs in *Route Control* message

Byte	Description
0, 1	Tag 0x0071
2, 3	Length 0x0002
4,5	Value[0-1] 0x0000

0x0076 SCCP Other Return Reason

Used in:

PPL Event Indication API message

Byte	Description
0, 1	Tag 0x0076
2, 3	Length 0x0001
4	Value[0] Reason Number 0x00 SCCP message syntax error 0x01 Unsupported message (connection-oriented)

0x0080 IP Signaling Series 3 Card Status

Used in:

Matrix Status Report message (0x00E5)

Byte	Description
0, 1	Tag 0x0080
2, 3	Length 0x0004

		0x11 G.729	10 ms

0x0101 RTP Payload Size (VDAC-ONE)

By changing the multiple of the payload size, you can configure how much encoded PCM data a packet contains.

Example: For G.711, a 160-byte payload of encoded PCM data is sent at the G.711 Basic Packet Rate of every 20 milliseconds. But if you change the multiple for G.711 to 2x, then a 320-byte payload is sent every 40 milliseconds.

In effect, changing the multiple also changes the throughput available over an Ethernet network. Larger packets create greater network delay overall, but they use the Ethernet bandwidth more efficiently. Smaller packets may use the Ethernet bandwidth less efficiently, but they may provide better voice quality.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Query message

Resource Attribute Configure message

Byte	Description
0, 1	Tag 0x0101 RTP Payload Size
2, 3	Length 0x0001
4	Value[0] Multiple of the basic packet rate. 0x01(Default) 0x02 0x03 0x04 0x05 0x06 0x07 0x08

0x0101 RTP Payload Size (IPN Series 2)

RTP payload sizes can be changed in multiples of the specified RTP Payload Type's base packetization rate. On the IP Network Interface Series 2 card, the RTP payload size is tightly coupled with RTP payload type. Changing the default RTP payload type also changes the default RTP payload size to its applicable value (unless a new default RTP payload size is also specified). Using the non-default RTP Payload Type during call establishment results in the default RTP Payload Size not being used. If the RTP Payload Size is not provided, the default for the specific payload type is used.

In effect, changing the multiple also changes the throughput available over an Ethernet network. Larger packets create greater network delay overall, but they use the Ethernet bandwidth more efficiently. Smaller packets may use the Ethernet bandwidth less efficiently, but they may provide better voice quality.

Used in:

0x1E Generic PPL ICB in:

Outsize Control message

0x0101 RTP Payload Size (IPN Series 3)

RTP payload sizes can be changed in multiples of the specified RTP Payload Type's base packetization rate. On the IP Network Interface Series 3 card, the RTP payload size is tightly coupled with RTP payload type. Changing the default RTP payload type also changes the default RTP payload size to its applicable value (unless a new default RTP payload size is also specified). Using the non-default RTP Payload Type during call establishment results in the default RTP Payload Size not being used. If the RTP Payload Size is not provided, the default for the specific payload type is used.

In effect, changing the multiple also changes the throughput available over an Ethernet network. Larger packets create greater network delay overall, but they use the Ethernet bandwidth more efficiently. Smaller packets may use the Ethernet bandwidth less efficiently, but they may provide better voice quality.

0x0104 RTP Packets Lost

Indicates the number of RTP packets lost.

Used in:

Channel Released with Data message

Byte	Description
0, 1	Tag 0x0104
2, 3	Length 0x0004
4-7	Value[0-3] Number of Packets Lost (4 Bytes)

0x0105 RTP Packets Received

Indicates the number of RTP packets received.

Used in:

Channel Released with Data message

Byte	Description
0, 1	Tag 0x0105
2, 3	Length 0x0004
4-7	Value[0-3] Number of Packets Received (4 Bytes)

0x0110 RTP Octets Received

Indicates the number of RTP octets received.

Used in:

Channel Released with Data message

Byte	Description
0, 1	Tag 0x0110
2, 3	Length 0x0004
4-7	Value[0-3] Number of Octets Received(4 Bytes)

0x0111 RTP Packets Sent

Indicates the number of RTP packets sent.

Used in:

Channel Released with Data message

Byte	Description
0, 1	Tag 0x0111
2, 3	Length 0x0004
4-7	Value[0-3] Number of Octets Received(4 Bytes)

0x0112 RTP Octets Sent

Indicates the number of RTP octets sent.

Used in:

Channel Released with Data message

Byte	Description
0, 1	Tag 0x0112
2, 3	Length 0x0004
4-7	Value[0-3] Number of Octets Sent (4 Bytes)

0x0115 Call Agent Mode

Enables Call Agent Mode which allows bearer-free calls.

Used in:

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x0115
2, 3	Length 0x0001
4	Value[0] Call Agent Mode: 0x00 - Disables Call Agent Mode 0x01 - Enables Call Agent Mode

0x0116 Channel Service TLV

Indicates whether the connection being established will be switched through the CSP or will bypass the CSP.

For VoIP calls, if this TLV is not present in one of the messages listed below, a switched CSP connection is created.

For non-VoIP calls, this TLV is ignored and an CSP switched connection is created.

Used in:

0x1E Generic PPL ICB in:

PPL Event Request message

Connect with Data message

Byte	Description
0, 1	Tag 0x0116
2, 3	Length 0x0001
4, 5	Value[0-1] Bearer Service Mode: 0x0000 - Bearer-switched through the CSP which implies a physical span channel. 0x0001 - Bearer-free. The CSP is bypassed which implies a virtual span channel.

0x0117 Alerting Propagation Mode

Use this TLV to indicate whether or not to suppress the automatic generation of the alerting signal by the CSP when the connected remote party sends out an alerting signal to the CSP. This TLV is for the SIP 180 message.

Used in:

0x1E Generic PPL ICB in:

PPL Event Request message

Connect with Data message

Byte	Description
0, 1	Tag 0x0117
2, 3	Length 0x0001
4	Value[0] 1 Suppress alerting 2 Do not suppress alerting (default)

0x0118 Companding Conversion Mode

Use this TLV to specify whether PCM encoding format conversion should be bypassed or not. The default is 0 in which case PCM encoding format is not bypassed. A value of 1 bypasses the conversion process and forces the B side of the call leg to use the A side's companding format.

Used in:

0x1E and 0x001E Generic PPL ICBs in:

Route Control message

Connect with Data message

Byte	Description
0, 1	Tag 0x0118
2, 3	Length 0x0002
4, 5	Value[0] 0x0000 Companding Conversion enabled (default) 0x0001 Companding Conversion disabled

0x0119 Media Offer Stage

Use this TLV with the Alerting or Progress call processing event to ask for a media connection before the Answer message is sent.

Used in:

0x1E Generic PPL ICB in:

PPL Event Request message

Byte	Description
0, 1	Tag 0x0119
2, 3	Length 0x0002
4	Value[0] 0x0000 - Do not offer media. 0x0001 - Offer media.

0x011A Call Agent Mode Physical Channel ID

Used in:

0x1E Generic PPL ICB in:

PPL Event Request message

Connect with Data message

Byte	Description
0, 1	Tag 0x011A - Call Agent Mode Physical Channel ID
2, 3	Length 0x0003
4,5	Value[0, 1] Span ID
6	Value[2] Channel ID

0x011B Reliable Provisional Response Mode

Used in:

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x011B
2,3	Length 0x0001
4	Value[0-3] 0 - Disabled (default) 1 - Support 2 - Require

0x011C SIP Stack T.38 Fax Support

Used in:

VoIP Protocol Configure (0x00EE)*VoIP Protocol Query* (0x00EF)

Byte	Description
0,1	Tag 0x011C SIP Stack T.38 Fax Support
2,3	Length 0x0001
4	Value[0] 00=Disabled 01=Enabled

0x0141 Modify Connection

Use this TLV to change the connection type of an established connection between two channels without having to park the channels during the transition. Add this TLV to the *Connect with Data* message along with the Connection Type TLV (0x0612). If you do not include the Connection Type TLV, the Modified Connection defaults to a two-way connection.

Used in:

0x1E Generic PPL ICB in:

Connect with Data message

Byte	Description
0, 1	Tag 0x0141 Modify Connection
2, 3	Length 0x0002
4,5	Value[0, 1] 0x0000 - Apply changes unconditionally (default)

0x0168 VDAC Module IP Address

Use this TLV to populate the Router Component (0x0064) with the VDAC module IP address.

Used in:

PPL Table Download message

Byte	Description
0, 1	Tag 0x0168
2, 3	Length 0x0004
4-7	Value[0-3] IP Address of VDAC module

0x01AE Poll Interval Configure

Use this TLV to specify the poll interval and the number of missed polls before a connection is declared down.

Used in:

VoIP Protocol Query message

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x01AE
2, 3	Length 0x0004
4	Value[0] Poll Interval, MSB: 0x00-0xFF
5	Value[1] Poll Interval, LSB: 0x00-0xFF
6	Value[2] Number of Missed Polls Before Link is Declared Down, MSB: 0x00-0xFF
7	Value[3] Number of Missed Polls Before Link is Declared Down, LSB: 0x00-0xFF

0x01C2 Minimum Jitter Buffer Delay

The data in this TLV block are in millisecond units. The range of legitimate values is 0-150 milliseconds.

Used in:

0x1E and 0x001E Generic PPL ICBs in:

Resource Attribute Query message

Resource Attribute Configure message

Byte	Description
0, 1	Tag 0x01C2 Minimum Jitter Buffer Delay
2, 3	Length 0x0001
4	Value[0] 0x00-0x96 ms (0x4B Default)

0x01C3 Maximum Jitter Buffer Delay (IPN-2 Card)

The data in this TLV block are in millisecond units. The range of legitimate values is 150-300 ms.

Used in:

0x1E and 0x001E Generic PPL ICBs in:

Resource Attribute Query message

Resource Attribute Configure message

Byte	Description
0, 1	Tag 0x01C3 Maximum Jitter Buffer Delay
2, 3	Length 0x0004

0x01C8 Protocol Type

Use this TLV to specify the protocol used by the TLVs in the *VoIP Protocol Configure* and *VoIP Protocol Query* messages.

Used in:

0x1E Generic PPL ICB in:
VoIP Protocol Configure message
VoIP Protocol Query message

Byte	Description	
0, 1	Tag	0x01C8
2, 3	Length	0x0001
4	Value[0]	0x04 SIP
		0x05 H.323
		0x06 RFC 2833

0x01C9 Primary Matrix IP Port

Use this TLV to specify the IP address and port number for the primary Call Agent. The port number must be greater than 0x0400 (1024).

Used in:

VoIP Protocol Query message

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x01C9
2, 3	Length 0x0006
4-7	Value[0-3] IP Address
8, 9	Value[1, 2] Port Number

0x01CA Secondary Matrix IP Port

Use this TLV to specify the IP address and port number for the secondary Call Agent. The port number must be greater than 0x0400 (1024).

Used in:

VoIP Protocol Query message

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x01CA
2, 3	Length 0x0006
4-7	Value[0-3] IP Address (4 bytes)
8, 9	Value[1, 2] Port Number

0x01D0 Gateway Mode

Use this TLV to configure an IP Network Interface Series 2 card to be in Gateway Mode or Normal Mode.

Important! This TLV is addressed to a card, and therefore cannot be combined in a message with any other TLVs.

Used in:

Resource Attribute Configure message

Byte	Description
0, 1	Tag: Gateway Mode (0x01D0)
2, 3	Length: 0x0001
4	Value: Setting 0x01 Gateway Mode (Non-port Consuming Mode) 0x02 Normal Mode (Port Consuming Mode)

0x01D1 RTP Payload Redundancy

Use this TLV to set the redundancy packet depth for RTP at configuration time. You can also set the RTP packet depth in real time, using an *Outseize Control* or *Route Control* message.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Query message

Resource Attribute Configure message

Byte	Description
0, 1	Tag: 0x01D1 RTP Payload Redundancy
2, 3	Length: 0x0001
4	Value[0] 0x00 No Redundancy (Default) 0x01 Redundancy Level 1 (Not supported by Profile 4 on the IPN-3 card.)

0x01D2 Fax Payload Redundancy

Use this TLV to set the redundancy packet depth for Fax at configuration time only.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Query message

Resource Attribute Configure message

Byte	Description
0, 1	Tag: 0x01D2 Fax Packet Depth
2, 3	Length: 0x0001
4	Value[0] ONE of the following: 0x00 No Redundancy (Default) 0x01 Redundancy Level 1 0x02 Redundancy Level 2 (VDAC-ONE card maximum) 0x03 Redundancy Level 3 (IP Network Interface Series 3 card only)

0x01D4 Type of Service

Use this TLV to set the quality of service for outgoing packets (RTP/RTCP/T.38). This attribute can be modified in a run-time environment.

Note that the signaling protocol is responsible to adhere to the RFC Standards when imposing type of service restrictions.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Resource Attribute Query message

Byte	Description
0, 1	Tag: Type of Service (0x01D4)
2, 3	Length: 0x0001
4	Value: Data[0] = b ₇ b ₆ b ₅ b ₄ b ₃ b ₂ b ₁ b ₀ b ₇ b ₆ b ₅ : Precedence: 000 Routine 100 Priority 010 Immediate 110 Flash 001 Flash Override 101 CRITIC/ECP 011 Internetwork control 111 Network control 0x00 (Default) b ₄ : Delay: 0 Normal delay (Default) 1 Low delay b ₃ : Throughput: 0 Normal throughput (Default) 1 High throughput b ₂ : Reliability: 0 Normal reliability (Default) 1 High reliability b ₁ : Cost: 0 Normal cost (Default) 1 Low cost b ₀ : This bit must be zero

0x01D6 DNS IP Address

Use this TLV to configure the DNS lookup in the CSP Matrix Series 3 Card. Use 0x00000000 if the Secondary or Tertiary DNS IP address is not used.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01D6
2, 3	Length 0x000C
4-7	Value[0-3] Primary DNS IP
8-11	Value[4-7] Secondary DNS IP
12-15	Value [8-11] Tertiary DNS IP

0x01D7 Default Domain Name

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01D7
2, 3	Length Variable
:	Value Null-terminated ASCII string for default domain

0x01DB Connection Mode

Use this TLV to set the connection mode. A line can be connected to receive only, transmit only, or both.

Used in:

Resource Attribute Configure message

Resource Attribute Query message

Byte	Description
0, 1	Tag Connection Mode (0x01DB)
2, 3	Length 0x0001
4	Value[0] 0x00 Two-way connection 0x01 One-way listen/receive only 0x02 One-way talk/transmit only 0x03 Hold connection. No voice is transmitted or received. 0xFF (Default) You see this value only if you query the default settings of a VoIP module or when the call is not connected.

0x01DC VoIP Module

Use this TLV to indicate a VoIP module.

Used in:
 0x00FB *ARP Cache Report* message

Byte	Description
0, 1	Tag 0x01DC VoIP Module
2, 3	Length 0x0001
4	Value[0] Module Number

0x01DD Flush ARP Cache Table Entry

Send this TLV to remove entries from an ARP Cache table. You must also include a VoIP Module TLV to indicate the module.

To remove all entries in the table, enter a length of 0x0000.

To remove an entry for a specific IP address, enter a length of 0x0004 and enter the IP address in Data[4-7].

To remove an entry for a specific Ethernet address, enter a length of 0x0006 and enter the Ethernet address in Data[4-9].

Used in:
ARP Cache Query

Byte	Description
0,1	Tag Flush ARP Cache Table Entry (0x01DD)
2, 3	Length Variable (see below)
4	Value:0x0000 To remove all entries on the module. There is no data. 0x0004 To remove a specific IP address. Also enter the IP address in Data[4-7]. 0x0006 To remove all entries at an Ethernet Address. Also enter the Ethernet address in Data[4-9].

0x01DE ARP Cache Table Entry

This TLV is used in the *ARP Cache Report* message to report the IP Address and Ethernet Address for an entry in the ARP Cache table. Separate TLVs are sent for each entry in the table.

Byte	Description
0, 1	Tag 0x01DE ARP Cache Table Entry
2, 3	Length 0x000E
4-7	Value[0-3] Entry Number
8-11	Value[4-7] IP Address
12-17	Value[8-13] Ethernet Address

0x01DF UDP Source Port Validate

Use this TLV to enable a VoIP media stream to be checked for its validity by authenticating the UDP source port of the incoming packets. The default value is 1 and implies that the UDP source port validation is performed on the received packets. By setting the value of this TLV to 1, the UDP source port field in every received packet (whether RTP, RTCP or T.38 packet) is validated.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Resource Attribute Query message

Byte	Description
0,1	Tag 0x01DF (UDP Source Port Validate)
2,3	Length 0x0001
4	Value[0] ONE of the following: 0x00 Disable 0x01 Enable (Default)

0x01E0 ARP Cache Report Information

This TLV is sent in the *ARP Cache Report* message to indicate the number of messages required for the report and the number of the current message.

Byte	Description
0	Tag 0x01E0
1	Length 0x0002
2	Value[0] Number of <i>ARP Cache Report</i> messages
3	Value[1] Current Message Number

0x01E1 Fax Compatibility Mode

Use this TLV to determine the VDAC-ONE card's T.38 Fax Relay Compatibility Mode:

- Backward Compatible mode

or

- Interoperability mode.

These modes are incompatible. You can choose one mode or the other, but not both. The Backward Compatible mode is interoperable with the fax relay mode on the previously-released software. The Interoperability Mode is primarily used to interoperate with third party T.38 fax relay.

This TLV can be configured only before the call is established. It cannot be configured during an active call. This TLV does not apply to the IP Network Interface Series 2 card.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01E1
2, 3	Length 0x0001
4	Value[0] 0x00 Backward compatible mode (Default) 0x01 Interoperability mode

0x01E2 RFC 2833 Enable

Use this TLV to allow the in-band DTMF signals to be relayed within the VoIP media stream utilizing a special RTP payload type. Low bit-rate audio codecs (such as G.729 or G.723.1) can compromise the signal integrity of DTMF digits (and other telephony tones and signals); hence causing inaccurate and poor detection/recognition of the DTMF digits at the recipient side. When this feature is enabled the incoming DTMF digits, if detected, are removed from the audio stream by the VDAC-ONE or IP Network Interface Series 2 card connected to the originator of the DTMF digits. The information regarding the detected and removed DTMF digits is embedded within the RTP stream using a special payload format. The VDAC-ONE or IP Network Interface

Series 2 card at the receiving side will decode this special RTP payload that carries DTMF digits and regenerate the DTMF signal toward the receiving PSTN side.

If you are using the VDAC-ONE card, this TLV can be configured only before or during the call establishment. It cannot be set during an active call. If you are using the IP Networking Series 2 card, this TLV can be configured while the call is active.

Important! The CSP does NOT support RFC 2833 via H.323 signaling.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure/Query message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01E2
2, 3	Length 0x0001
4	Value[0] 0x00 RFC 2833 disabled (in-band digit transmission) (Default) 0x01 RFC 2833 enabled (out-of-band digit transmission) 0x02 Digit transmission disabled

0x01E5 VoIP Resource Profile Assign

The Resource Profile Assign (0x01E5) TLV has been created to configure a module's resource profile. Similar to changing the Gateway Mode, changing a VoIP module resource profile causes its TDM resources to change, causing the IP Network Interface Series 2 card to reset, so that new resources can be allocated.

Important! Changing the resource profile on any module causes the IP Network Interface Series 2 card host configuration to be reset.

You cannot mix VoIP resource profiles on the same IP Network Interface Series 2 card or in the same chassis.

The Resource Profile Assign (0x01E5) TLV addresses the VoIP module by its module number. Since updating a VoIP module's profile causes the IP Network Interface Series 2 card to reset, all of the modules can be reset in a single message.

The host has the flexibility to send one VoIP Resource Profile Assign TLV to assign the same resource profile to all modules or send multiple TLVs to individual modules. If any TLV is invalid, the message is negatively acknowledged (NACKED) and no action is taken.

Used in:

Resource Attribute Configure message

Byte	Description
0, 1	Tag VoIP Resource Profile Assign (0x01E5)
2, 3	Length 0x0003
4	Value: Data [0] Module Number 0x00 Module 1 0x01 Module 2 0xFF All Populated VoIP Modules
5	Value: Data [1] Profile Number 0x01 Profile 1 (IP Network Interface Series 2 - G.711 Only) 0x02 Profile 2 (IP Network Interface Series 2 - VDAC-ONE Compatibility.) 0x04 Profile 4 (IP Network Interface Series 3 - G.711 Only) 0x05 Profile 5 (IP Network Interface Series 3 - LBR+T.38)
6	Value: Data [2] Force Flag 0x00 Update only if Spans have not been configured. 0xFF Update Unconditionally

0x01E6 Source T.38 Port

Use this TLV to specify the local T.38 port number for the fax relay. This TLV can be set on-the-fly. There is no default value for this TLV (i.e., no default T.38 port will be assumed). Therefore is imperative for the Host to resolve this port number as early as possible to ensure the proper fax relay operation. If this port number is not specified (in time), the fax relay will fail.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01E6
2, 3	Length 0x0002
4, 5	Value[0, 1] T.38 Port

0x01E7 Destination T.38 Port

Use this TLV to specify the remote T.38 port number for the fax relay. This TLV can be set on-the-fly. There is no default value for this TLV (i.e., no default T.38 port will be assumed). Therefore is imperative for the Host to resolve this port number as early as possible to ensure the proper fax relay operation. If this port number is not specified (in time), the fax relay will fail.

Used in:

0x1E Generic PPL ICB in:

Byte	Description
0, 1	Tag 0x01E7
2, 3	Length 0x0002
4, 5	Value[0, 1] T.38 Port

0x01E8 Source RTCP Port

Use this TLV to specify the local RTCP port number for the fax relay. This TLV can be set on-the-fly. If this port is not specified by the host during the call setup, per RFC 1889, by default the source RTCP port is at an offset of 1 from the source RTP port.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01E8
2, 3	Length 0x0002
4, 5	Value[0, 1] RTCP Port

0x01E9 Destination RTCP Port

Use this TLV to specify the remote RTCP port number for the fax relay. This TLV can be set on-the-fly. If this port is not specified by the host during the call setup, per RFC 1889, by default the destination RTCP port is at an offset of 1 from the destination RTP port.

Used in:
 0x1E Generic PPL ICB in:

0x01EB RTP Timer Timeout (VDAC-ONE)

Allows you to create a timer for monitoring the first incoming packet (for example, RTP, RTCP, or T.38) for each channel. If the timer expires before the first packet is received, a PPL Event Indication is generated, with an Event ID of 0x07.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01EB
2, 3	Length 0x0004
4, 5	Value[0, 1] 0x0000
6, 7	RTP Timer Timeout Value (2 Bytes - 10 ms increments) 0x0000 - 0xFFFF ms 0x0000 is the default, and it means that the timer is disabled. Any other value automatically enables the timer to that value.

0x01EB Initial Media Inactivity Timeout (IP Network Interface Series 2 Card)

Allows you to create a timer for monitoring the first incoming packet (for example, RTP, RTCP, or T.38) for each channel. If the timer expires before the first packet is received, a PPL Event Indication is generated, with an Event ID of 0x07.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x01EB
2, 3	Length 0x0004
4, 5	Value[0, 1] 0x0000
6, 7	RTP Timer Timeout Value (2 Bytes - 10 ms increments) 0x0000 - 0xFFFF ms 0x0000 is the default, and it means that the timer is disabled. Any other value automatically enables the timer to that value.

0x01EC Media Inactivity Detection Timer

Use this TLV to create a timer for monitoring the incoming RTCP packets (VDAC-ONE) or UPD packets (IPN Series 2) at a per module or a per channel basis to detect possible media inactivity occurrence. When this timer is enabled for a particular channel, if the configured timer value has elapsed and no RTCP/UPD packets are received, then this timer will expire and generate a PPL Event Indication with Event ID of 0x08 to alert the host of a possible media inactivity detection. RTCP/UPD must be supported by remote endpoints for this TLV to work.

Used in:

0x1E Generic PPL ICB in:

Resource Attribute Configure message

Route Control message

Outseize Control message (not for SIP or H.323)

Byte	Description
0, 1	Tag 0x01EC
2, 3	Length 0x0004
4, 5	Value[0,1] 0x0000
6, 7	RTP Timer Timeout Value (2 Bytes - 10 ms increments) 0x00 - 0xFFFF ms. 0x00 is the default, and it means that the timer is disabled. Any other value automatically enables the timer to that value.

0x01ED RFC 2833 Jitter Buffer Size

Indicates the size of the RTP jitter buffer in milliseconds. The range is 0-400 milliseconds. The default is 200 milliseconds.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01ED
2, 3	Length 0x0002
4, 5	Value[0] Value in milliseconds. 0x0000-0x0190 (0-400 ms) 0x00C8 (200 ms) is the default

0x01EE Invalid Packet Alarm Threshold

Indicates the alarming threshold for the number of invalid non-RFC 2833 packets received by the CSP. The CSP generates an alarm every time the number of invalid packets exceeds the threshold limit in a one-second period. The alarming is on a per RFC 2833 channel basis.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01EE
2, 3	Length 0x0002
4, 5	Value[0,1] Number of invalid packets that justify alarm generation. 0x0000 - 0xFFFF 0x0032 is the default

0x01EF Initial UDP Port Number

Specifies the first UDP port number that will be used for receiving the RFC 2833 stream from an endpoint. The CSP increments the port number beyond this "seed" by two for every new call. The port number rolls over to the initial value once all the configured ports are exhausted.

You specify the number of UDP ports in the Number of UDP Ports 0x01F0.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01EF
2, 3	Length 0x0002
4, 5	Value[0,1] Initial port number above 1024. 0x0400 - 0x2710 (1024-10,000) 0x2710 is the default

0x01F0 Number of UDP Ports

Specifies the total number of RFC 2833/RTP/UDP ports that the CSP is allowed to open. For a multiport scheme, this number is the number of RFC 2833 channels requested by a host application. Select 0 to specify that only one port needs to be opened that will multiplex all of the RFC 2833 streams. Any value other than 0 implies a multi-port scheme and the actual number of UDP ports required for each RFC 2833 channel basis.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x01F0
2, 3	Length 0x0002
4, 5	Value[0,1] 0 - implies single port scheme. 1 is the default Any other value implies multiport scheme. The number should be equal to or less than the the CSP maximum channel capacity.

0x01F1 RFC 2833 Dynamic Payload Type

Indicates the dynamic payload type number that the CSP will utilize for specifying the RFC 2833 multi-unicast media stream to the peer endpoint.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Outsize Control message

Route Control message

Resource Attribute Configure message

Byte	Description
0, 1	Tag 0x01F1
2, 3	Length 0x0001
4, 5	Value[0,1] 96-127 Dynamic Payload Type (0x60 - 0x7F) Default is 96 (0x60) Values 102, 103, and 105 (0x66, 0x67, 0x69) are reserved. The VDAC-ONE card rejects these values. The IPN-2 card allows using these values but the host application is responsible for resolving conflicts.

0x01F2 RFC 2198 Dynamic Payload Type

Indicates the dynamic payload type number that the CSP will utilize for specifying the RFC 2198 redundant RTP payload to the peer end-point.

Used in:

VoIP Protocol Configure message

Outseize Control message

Route Control message

Resource Attribute Configure message

Byte	Description
0, 1	Tag 0x01F2
2, 3	Length 0x0001
4, 5	Value[0,1] 96-127 Dynamic Payload Type (0x96 - 0x7F) Default is 104 (0x68) Values 102, 103, and 105 (0x66, 0x67, 0x69) are reserved. The VDAC-ONE card rejects these values. The IPN-2 card allows using these values but the host application is responsible for resolving conflicts.

0x01F4 Media Recovery Method

Defines how a module on an IPN-2 card recovers from DSP failures that result in the loss of VoIP channels.

Used in:

Resource Attribute Configure message

Resource Attribute Query message

Byte	Description
0, 1	Tag 0x01F4
2, 3	Length 0x0004
4	<p>Value[0] Recovery Procedure</p> <p>0x00 - Disable (Default) No special recovery options; backward compatible</p> <p>0x01 - Immediate forced bleed-off</p> <p>Immediate forced bleed-off of all resources from the Calisto DSP.</p> <p>Calisto DSP is reset when there are no active resources.</p> <p>All four Calisto DSPs in the module gets reset one after the other.</p> <p>This recovery procedure is not cyclic. It runs once when this method is enabled by host. After the procedure completes the media recovery method shall be disabled.</p> <p>0x02 - Immediate forced bleed-off on loss of DSP resources</p> <p>Immediate forced bleed-off of all resources in a Calisto DSP when the number of lost resources in a DSP goes below the threshold values.</p> <p>Calisto DSP reset when no active resources.</p> <p>Only that single Calisto DSP is reset.</p> <p>This recovery procedure is cyclic. It will remain enabled until the it is disabled explicitly. The procedure is triggered whenever the fatal error exceeds the threshold value.</p> <p>The fatal error count shall be reset after the procedure completes.</p>

5	<p>Value[1] Max wait time</p> <p>The maximum time to wait for all resources to become idle in the calisto DSP chips. On timeout the active calls in the Calisto DSP are dropped. This field is counted in units of 20 seconds.</p> <p>0x00 – Do not wait reset immediately (Forced Reset) 0x01 to 0xFE – Wait for Value[1]*20 seconds (20s to 1h 24m 40s) 0xFF – Wait forever till all the channels are idle</p> <p>This field is not applicable if Value [0] is set to 0x00.</p>
6	<p>Value[2] DSP fatal error threshold value</p> <p>The number of fatal errors to happen in a single Calisto to before triggering the media recovery procedure.</p> <p>Valid Values range from 1 to 127 for Profile 1 Valid Values range from 1 to 62 for Profile 2</p>
7	<p>Value[3] Calisto (DSP) Number to be reset</p> <p>This field is a bit map of DSPs to be reset.</p> <p>0x00 – Reset all DSPs Bit 0 – Set if DSP Number 0 is to be reset Bit 1 – Set if DSP Number 1 is to be reset .. Bit n – Set if DSP Number n is to be reset</p> <p>The valid Calisto numbers range from 0x00-0x007.</p> <p>This field is applicable only if Value[0] is set to 0x01.</p>

0x0262 Use SIP Local Port

Use this TLV to specify the local SIP port number. The default port number is 0x13C4 (5060).

Used in:

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x0262
2, 3	Length 0x0002
4, 5	Value[0,1] Port Number

0x0263 Use SIP Remote Port/Default Proxy Port

Use this TLV to specify the port number of a remote SIP server. The default port number is 0x13C4 (5060).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0263
2, 3	Length 0x0002
4, 5	Value[0,1] Port Number 5060 (default)

0x0264 Use SIP Remote Host/Default Proxy Host

Use this TLV to specify the remote default proxy host. The value is a null-terminated ASCII string representing either an IP address (for example, 10.10.10.10) or domain name (for example, sip.excel.com). To de-configure the SIP default proxy host use this value: 0.0.0.0.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0264
2, 3	Length Variable
4-N	Value Null terminated ASCII string

0x0265 Use SIP Site ID

Use this TLV to specify the site ID that is used to generate the call ID. The default value is UNSET.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0265
2, 3	Length Variable
4 . . .	Value[0 . . .] Site ID (Null terminated ASCII text string) EXCEL (Default)

0x0266 Use SIP Anonymous Caller

Use this TLV to specify the default caller number that is used when no caller number is specified. The default caller number is 0x0000000000000000 (00000000).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0266
2, 3	Length Variable
4 . . .	Value[0 . . .] Caller Number (Null terminated ASCII text string)

0x0267 Use SIP Invite T1 Timer

Use this TLV to specify the T1 timer value for an INVITE request in milliseconds. The default value is 0x1F4 (500 milliseconds).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0267
2, 3	Length 0x0004
4-7	Value[0-3] T1 Timer (4 bytes)

0x0268 Use SIP BYE T1 Timer

Use this TLV to specify the T1 timer value for BYE in milliseconds. The default value is 0x1F4 (500 milliseconds).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0268
2, 3	Length 0x0004
4-7	Value[0-3] T1 Timer (4 Bytes)

0x0269 Use SIP T2 Timer

Use this TLV to specify the T2 timer value in milliseconds. The default value is 0xFA0 (4000 milliseconds).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0269
2, 3	Length 0x0004
4-7	Value[0-3] T2 Timer (4 Bytes)

0x026A Use SIP Maximum Retransmissions Invite

Use this TLV to specify the maximum retransmissions for an INVITE request. The default value is 0x07.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x026A
2, 3	Length 0x0001
4	Value[0] Maximum Number of Transmissions

0x026B Use SIP Max Retransmissions BYE

Use this TLV to specify the maximum retransmissions for a BYE request (any request other than INVITE). The default value is 0x0B.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x026B
2, 3	Length 0x0001
4	Value[0] Maximum Transmissions

0x0270 SIP Tunnel Type

For all outgoing messages, this TLV enables and disables the use of tunneled data and specifies the tunneled data type.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0270
2, 3	Length 0x0002
4-6	Value[0-2] 0x0001 No tunneling (Default) 0x0002 CSP UPDF Tunneling 0x0004 Customize MIME Body

0x0272 Use SIP Registration Timeout

Use this TLV to specify the default registration expiration period in seconds that is used when no registration expiration period is specified. The default value is 0x00000E10 (3600 seconds).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0272
2, 3	Length 0x0004
4-7	Value[0-3] Registration Expiration Period (4 Bytes)

0x0274 Use No Local Media

Use this TLV to specify the way to handle a situation where there is no VDAC-ONE or IP Network Interface Series 2 card.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0274
2, 3	Length 0x0001
4	Value[0] Media Handling 0x00 Not in the media path - no VDAC-ONE or IP Network Interface Series 2 cards available 0x01 Terminate media locally - VDAC-ONE or IP Network Interface Series 2 cards (Default)

0x0275 Local Registration Enable/Disable

Use this TLV to enable or disable the acceptance of local registrations within the CSP.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0275
2, 3	Length 0x0001
4	Value[0] Local Registration Enable/Disable 0x00 Disable local storage of registrations 0x01 (Default) Store up to 2048 SIP phone registrations locally in the CSP.

0x0277 SIP Version

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0277
2, 3	Length 0x0002
4,5	Value[0,1] MSB - Major Version LSB - Minor Version

0x0279 SIP Local Route Lookup

Use this TLV to enable and disable local registration lookup, even if the Route Control message has the “To” IP address. If this TLV is enabled, the supplied “To” IP address is ignored. If you use internal routing and you want to make a SIP-to-SIP call, Dialogic recommends enabling this TLV. You can enable and disable the local route lookup feature for an individual call by using the NPDI SIP Local Lookup TLV (0x2914).

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0279
2, 3	Length 0x0001
4	Value[0] 0x00 Disable (Default) 0x01 Enable

0x027A SIP Registration Mode

Use this TLV to configure the CSP for different registration modes.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description								
0, 1	Tag 0x027A								
2, 3	Length 0x0001								
4	Value[0] <table border="0" style="margin-left: 20px;"> <tr> <td>0x00</td> <td>Do not notify host (Default) All registrations are handled locally, without host intervention.</td> </tr> <tr> <td>0x01</td> <td>Notify host Registrations are stored locally, and the host is notified by a PPL Event Indication. The host has no control over the response generated.</td> </tr> <tr> <td>0x02</td> <td>Notify host and wait for response All registrations are added to the local database. The host is notified by a PPL Event Indication, and waits for a PPL Event Request before sending a response to the UA client.</td> </tr> <tr> <td>0x03</td> <td>Accept no registration</td> </tr> </table>	0x00	Do not notify host (Default) All registrations are handled locally, without host intervention.	0x01	Notify host Registrations are stored locally, and the host is notified by a PPL Event Indication. The host has no control over the response generated.	0x02	Notify host and wait for response All registrations are added to the local database. The host is notified by a PPL Event Indication, and waits for a PPL Event Request before sending a response to the UA client.	0x03	Accept no registration
0x00	Do not notify host (Default) All registrations are handled locally, without host intervention.								
0x01	Notify host Registrations are stored locally, and the host is notified by a PPL Event Indication. The host has no control over the response generated.								
0x02	Notify host and wait for response All registrations are added to the local database. The host is notified by a PPL Event Indication, and waits for a PPL Event Request before sending a response to the UA client.								
0x03	Accept no registration								

0x027B Session Interval

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Use this TLV to set the value of the session-expire header (in seconds) in the SIP messages generated by the CSP.

Byte	Description
0, 1	Tag 0x027B
2, 3	Length 0x0004
4-7	Value[0] Variable 1800 (30 minutes) (Default) 0x00 00 07 08

0x027C Min-SE Interval

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Use this TLV to set the Min-SE header field (in seconds) which conveys the minimum allowed value for the session timer. The Min-SE Interval has to be less than the Session Interval. The maximum value is 0x7F FF FF FE.

Byte	Description
0, 1	Tag 0x027C
2, 3	Length 0x0004
4-7	Value[0] Variable 300 (5 minutes) (Default) 0x00 00 01 2C

0x027D SIP Transport Type

Specifies the default transport type for outbound call. If this TLV does not appear in the *VoIP Protocol Configure* message, the CSP uses the default - UDP.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x027D
2, 3	Length 0x0001
4-7	Value[0-3] 1 - UDP 2 - TCP

0x027F SIP Message Information Mask

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

The host uses this TLV to specify the additional SIP message information to the host in the *Request for Service with Data* message.

Byte	Description
0, 1	Tag 0x027F
2, 3	Length 0x0004
4-7	<p>Value[0-3] This field is a 32-bit mask. Each bit selects specific SIP message fields and is listed from LSB to MSB.</p> <p>0 - Disabled (Default) 1 - Enabled</p> <p>Bit 0 Selects the Dialog Information that contains Call-ID, From Tag and To Tag</p> <p>Bit 1 Selects the Proxy-Authorization Header</p> <p>Bit 2 Selects the Authorization Header</p> <p>Bit 3 Selects the Request for URI information</p> <p>Bit 4 Selects Media Connection Address</p> <p>Bit 5 Selects the Contact URI Parameter information</p> <p>Bit 6 Selects the Request URI Parameter information for proprietary information</p> <p>Bit 7 Selects reporting of Remote Party ID header field(s)</p> <p>Bit 8 Selects reporting of RPID Privacy header field(s)</p> <p>Bit 9 Selects reporting of Subject header field</p> <p>Bit 10 Selects reporting of Via header field</p> <p>Bit 11 Selects reporting of Subject header field in the REFER message.</p> <p>Bit 12 Selects reporting of Refer-To Header Parameters.</p> <p>Bit 13 Selects reporting of Contact display name, username and parameter in 200OK for INVITE and REFER</p> <p>Bit 14 Selects reporting of SIP Supported and Require option tags in the INVITE, 180, and 183 messages</p> <p>Bit 15 Selects reporting of P-Headers and Privacy header</p> <p>Bit 16 Selects reporting of Call-ID for SIP outbound calls.</p> <p>Bit 17 Selects SDP Non-Audio Media Stream Native Text Propagation in Call Agent Mode</p> <p>Bit 18 - Selects reporting of Referred-By header in REFER and INVITE request</p> <p>Bit 19 - Selects reporting Subscription Stack header</p> <p>Bit 20 - Selects reporting of MIME data in incoming messages.</p> <p>Bit 21 - Selects reporting Refer Request URI</p> <p>Bit 22 - Selects reporting SIP Access to Parameter in To Header</p> <p>Bits 23-31 Reserved</p>

0x027E SIP Persistent Sockets

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

This TLV forces all TCP sockets to be persistent.

Byte	Description
0, 1	Tag 0x027E
2, 3	Length 0x0001
4-7	Value[0-3] 0 disable (default) 1 enable

0x0280 SIP Existing Socket Reuse

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

For Connection oriented sockets, this TLV allows (or prevents) the reuse of any SIP socket which may exist between this host and the target endpoint. When this TLV is disabled, a new socket will be opened for each SIP Request.

Byte	Description
0, 1	Tag 0x0280
2, 3	Length 0x0001
4-7	Value[0-3] 0 disable (default) 1 enable

0x0281 SIP Idle Socket Timeout

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

For connection oriented sockets that are not persistent, this TLV maintains an idle timer to determine when a socket should be closed.

Byte	Description
0, 1	Tag 0x0281
2, 3	Length 0x0002
4-7	Value[0-3] The number of idle seconds to wait before closing a non-persistent socket. Default is 32 seconds. Minimum is five seconds. Maximum is 32,766 seconds.

0x0282 PPL Event Notification Mask

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x0282
2, 3	Length 0x0004
4-7	<p>Value[0-3] 32 bit mask with each bit selects specific PPL Event Indication.</p> <p>Bit 0 - Media changed via the RE-INVITE message (Event ID 0x001E)</p> <p>Bit 1 - 200 OK Received (Event ID 0x0020)</p> <p>Bit 2 - 183 received (Event ID 0x001F)</p> <p>Bit 3 - 180 received (Event ID 0x0024)</p> <p>Bit 4 - ACK with SDP (Delayed Media)</p> <p>Bit 5 - PRACK received (Event ID 0x002A)</p> <p>Bit 6 - On server side, report INFO message received (Event ID 0x002C). On client side, report the response received for INFO message sent (Event ID 0x002D).</p> <p>Bit 7 - 182 Received (Event ID 0x002E)</p> <p>Bit 8 - Options message received. (Event ID 0x002F)</p> <p>Bit 9 - 181 Received (Event ID 0x0030)</p> <p>Bit 10 - 422 Received (Event ID 0x0031)</p> <p>Bits 8-31. Undefined.</p> <p>Bits 0, 1, 2, 4, 5, and 10 are enabled by default. All other bits are disabled by default.</p>

0x0283 Minimum Registration Duration

Used in:

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x0283 - Minimum Registration Duration
2,3	Length 0x0004
4-7	Value[0-3] Time period in seconds

0x0284 Resynchronize VoIP Media Parameter

Use this TLV to resynchronize VoIP media parameters (maintained locally by SIP and H.323 software) after the *Resource Attribute Configure* message is sent to the CSP to change the underlying VoIP media resource configuration.

Used in:

VoIP Protocol Configure message

Byte	Description
0, 1	Tag 0x0284
2, 3	Length 0x0001
4-7	Value[0-3] 0 - No operation 1 - Resynchronize

0x0286 SIP Max Forwards

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x0286
2, 3	Length 0x0002
4,5	Value[0] 0x00 - Disable 0x01 - Enable
:	Value[1] Variable (0x00-0xFF) Max-Forwards value

0x02BC Gatekeeper IP and Port

The Gatekeeper IP and Port Configure TLV is used only if the RAS module is configured during the stack configuration.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x02BC Gatekeeper IP and Port
2, 3	Length 0xNNNN
4	Value[0] Configure/Deconfigure option 0x00 Configure (Default) 0x01 Deconfigure
5	Value[1] Number of Gatekeepers. 0x01 (Default) First entry is primary Gatekeeper. The rest are alternate Gatekeepers 0xM (M = 0x01 - 0x06)
6-9	Value[2-5] IP Address
10, 11	Value [6-7] Port Number
:	Value [8-11] IP Address (4 Bytes)
:	Value [12-13] Port Number (2 Bytes)
:	:

0x02BE Variant ID

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x02BE Variant ID
2, 3	Length 0x0002
4, 5	Value[0, 1] Variant ID 0x0000 ITU (Default)

0x02BF Version Number

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x02BF Version Number
2, 3	Length 0x0002
4, 5	Value[0, 1] Version Number 0x0002 H.323 V2 (Default)

0x02C0 Terminal Type

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x02C0 Terminal Type
2, 3	Length 0x0002
4	Value[0] 0x00 (Default) Terminal Type (MSB)
5	Value[1] Terminal Type (LSB) 0x3C GW with no MC (Default) 0x50** GW with MC but no MP 0x5A** GW with MC and Data MP 0x64** GW containing MC w/data & audio 0x6E** GW containing MC w/data, audio, & video **Not supported in this release.

0x02C1 Vendor ID

Used for Gateway H.323 ID registration as well as Vendor ID. The value is a ASCII null terminated string that spells out the default value "EXCEL-CSP" as indicated below.

Important! You cannot deconfigure the Vendor ID.

Used in:

0x0033 NPDI Universal ICB in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C1 Vendor ID
2, 3	Length 0x0A (Default)
4	Value[0] 0x45 E
5	Value[1] 0x58 X
6	Value[2] 0x43 C
7	Value[3] 0x45 E
8	Value[4] 0x4C L
9	Value[5] 0x2D --
10	Value[6] 0x43 C
11	Value[7] 0x53 S
12	Value[8] 0x50 P
13	Value[9] 0x00 (Null)

0x02C2 Gatekeeper Auto Discovery

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2C2 Auto Discovery
2, 3	Length 0x0002
4, 5	Value[0, 1] Auto Discovery 0x0000 Disabled (Default) 0x0001 Enabled

0x02C3 Gatekeeper Auto Registration

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2C3 Auto Registration
2, 3	Length 0x0002
4, 5	Value[0, 1] Auto Registration 0x0000 Disabled (Default) 0x0001 Enabled

0x02C4 Gateway E164

This TLV contains the alias address which is added to the outbound H.323 setup message if the *Outseize Control* message or *Route Control* message does not contain the calling party number.

You can deconfigure the Gateway ID by setting this value to Null.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C4 Gateway E164
2, 3	Length Variable (maximum 32-byte ASCII character strings)
:	Value [n] 0-9, #, * Last character must be 0. Default is Null

0x02C6 Gateway URL ID

Important! You can deconfigure the Gateway URL ID by setting it to Null.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C6 Gateway URL ID
2, 3	Length Variable (maximum 512-byte ASCII character strings)
:	Value [n] 0-9, #, * Last character must be 0. Default is Null

0x02C7 Gateway E-mail ID

Important! You can deconfigure the Gateway E-mail ID by setting it to Null.

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C7 Gateway E-mail ID
2, 3	Length Variable (maximim 512-byte ASCII character strings)
:	Value [n] 0-9, #, * Last character must be 0. Default is Null

0x02C8 H.225 T301 Timer

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C8 H225 T301 Timer configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x4650 (Default) All timer values are used in units of 10 ms each.

0x02C9 H.225 T303 Timer

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x2C9 H225 T303 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0190 (Default) All timer values are used in units of 10 ms each.

0x02CA H.225 T310 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CA H225 T310 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x03E8 (Default) All timer values are used in units of 10 ms each.

0x02CB H.245 T101 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CB H245 T101 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0BB8 (Default) All timer values are used in units of 10 ms each.

0x02CC H.245 T103 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CC H245 T103 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0BB8 (Default) All timer values are used in units of 10 ms each.

0x02CD H.245 T105 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CD H245 T105 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x01F4 (Default) All timer values are used in units of 10 ms each.

0x02CE H.245 T106 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CE H245 T106 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0BB8 (Default) All timer values are used in units of 10 ms each.

0x02CF H.245 T108 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2CF H245 T108 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0BB8 (Default) All timer values are used in units of 10 ms each.

0x02D0 H.245 T109 Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2D0 H245 T109 Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0BB8 (Default) All timer values are used in units of 10 ms each.

0x02D1 RAS GRQ Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2D1 RAS GRQ Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0064 (Default) All timer values are used in units of 10 ms each.

0x02D2 RAS RRQ Timer

Used in:

VoIP Protocol Configure message*VoIP Protocol Query* message

Byte	Description
0, 1	Tag 0x2D2 RAS RRQ Timer Configure
2, 3	Length 0x0002
4, 5	Value[0, 1] 0x0064 (Default) All timer values are used in units of 10 ms each.

0x02D3 Gateway Technology Prefix

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

Byte	Description
0, 1	Tag 0x02D3 Gateway Technology Prefix
2, 3	Length Variable. 0x0003 (Default) Maximum 10 bytes.
:	Value [n] ASCII null terminated string. Default is as follows: 0x31 - 1 0x23 - # 0x00 - Null

0x02D4 H.323 Message Information Mask

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

The host uses this TLV to specify the additional H.323 message information in the *Request for Service with Data* message.

Byte	Description
0, 1	Tag 0x02D4
2, 3	Length 0x0004
4-7	Value[0] This field is a 32-bit mask. Each bit selects specific H.323 message fields and is listed from LSB to MSB. Bit 0 Reserved Bit 1 Reserved Bit 2 Reserved Bit 3 Reserved Bit 4 Selects Media Connection Address Bits 5-31 Reserved (Note: 0x10 = Select Media Connection Address) By default, all bits are set to 0. 0x00000000 - Null

0x02D5 H.245 Tunneling Configure

Used in:

VoIP Protocol Configure message

VoIP Protocol Query message

This TLV globally turn tunneling on and off. When this TLV is set to enable, the IP Signaling card accepts incoming H.323 calls with the H.245 tunneling feature.

Byte	Description
0, 1	Tag 0x02D5
2, 3	Length 0x0001
4-7	Value[0] 0 - Disabled (default) 1 - Enabled

0x05DC File Management Configuration

Use this TLV to specify the type of server to be used for recorded voice files. This TLV is used in the *Generic Card Configure* message and in the response to the *Generic Card Query* message for the DSP Series 2 card.

Byte	Description
0, 1	Tag 0x05DC File Management Configuration
2, 3	Length 0x0001
4	Value[0] 0x01 NFS

0x05DD Server Address

Use this TLV to specify the name and location of the NFS server used for voice files. This TLV is used in the *Generic Card Configure* message and in the response to the *Generic Card Query* message.

Byte	Description
0, 1	Tag 0x05DD Server Address
2, 3	Length Variable
4, 5	Value[0] Server ID (application-defined)
6-9	Value[1] Primary IP Address (all zeros deletes the socket)
10, 11	Value[2] Server Name Length
12-N	Value[3] Server Name
(2 bytes)	Value[4] Mount Name Length (max 32 bytes)
...	Value[5] Mount Name of Server

0x05DF Vocabulary Index File

Use this TLV to specific the server ID, path, and name for the Vocabulary Index File, which in turn tracks the name, ID, and location of recorded voice files.

This TLV is used in the *Generic Card Configure* message and in the response to the *Generic Card Query* message.

Byte	Description
0, 1	Tag 0x05DF Vocabulary Index File
2, 3	Length Variable
4, 5	Value[0, 1] Primary Server ID (ID of server the file is on)
6, 7	Value[2, 3] Secondary Server ID (For TFTP only--future). This is a secondary Server to look for the Vocabulary Index File (VIF) on. Any time the VIF is updated, the software tries the primary server, and if there is no response, attaches to the secondary server. When the VIF is updated, all caches are cleared.
8, 9	Value[4, 5] Primary File Name Length
10-N	Value[6-N] Primary File Name with Path, not including Mount name (max 100 bytes). The path must begin with one forward slash (/) or two backward slashes (\\)
(2 bytes)	Secondary Name Length (0=no secondary file)
(... -N)	Secondary File Name with Path, not including Mount name (max 100 bytes). The path must begin with one forward slash (/) or two backward slashes (\\)

0x05E0 File ID

Use this TLV to identify recorded voice files numerically.

This TLV is used in the *DSP Cache Modify*, *Play File Start*, and *Record File Start* messages.

Byte	Description
0, 1	Tag 0x05E0 File ID
2, 3	Length 0x0004
4-7	Value[0] File ID <u>RAN IDs 0x00100000 or higher:</u> These must be played alone (not chained), and the CSP must first be configured for NFS with the <i>Generic Card Configure</i> message. Files with these IDs are not stored on the card. <u>RAN IDs lower than 0x00100000:</u> You can chain these

0x05E1 File Format

Use this TLV to specify the file format and encoding format for recorded voice files for file IDs of 0x00100000 or higher in the *Play File Start* message and in the *Record File Start* message.

Also use this TLV in the *DSP Cache Modify* message when the Action field is set to Copy (the Encoding Format field is ignored; the encoding format of the file copy will always be the same format as the original file).

Byte	Description
0, 1	Tag: 0x05E1 File Format
2, 3	Length: 0x0002
4	Value[0]: File Format 0x00 - raw (packed raw binary data) 0x01 - vox 0x02 - wav
5	Value[1]: Encoding Format (for raw, vox and wav file types) 0x00 - G.711 A-law PCM 0x01 - G.711 μ -law PCM 0x02 - G.726 32 Kbps ADPCM 0x03 - 32 Kbps OKI ADPCM (Dialogic) 0x04 - 24 Kbps OKI ADPCM (Dialogic) 0x05 - 11025 Hz 16-bit 0x06 - 11025 Hz μ -law 0x07 - 11025 Hz A-law 0x08 - 11025 Hz 8-bit 0x09 - 8000 Hz 8-bit 0x0A - 8000 Hz linear 0x0B - G.726 40 Kbps 0x0C - G.726 24 Kbps 0x0D - G.726 16 Kbps (NOTE: The .wav format is derived from actual file)

0x05E2 File Location

Use this TLV to specify the location of recorded voice files.

This TLV is mandatory for file IDs of 0x00100000 or higher in the *Play File Start* message, and in the *Record File Start* message.

It is also mandatory in the *DSP Cache Modify* message when the Action field is set to Copy.

Byte	Description
0, 1	Tag 0x05E2 File Location
2, 3	Length Variable
4, 5	Value[0, 1] Primary Server ID
6, 7	Value[2, 3] Secondary Server ID
8-N	Value[4-N] Filename, not including Mount name (must begin with / or \\) 128 characters maximum

0x05E3 Gain

Use this TLV to modify the gain of recorded voice files.

This TLV is used in the following messages:

- *Play File Start*
- *Record File Start*
- *Play File Modify*
- *Record File Modify*

Byte	Description
0, 1	Tag 0x05E3 Gain
2, 3	Length 0x0001
4	Value[0] Gain, expressed in decibels Minimum -54 (0xCA) Maximum 24 (0x18) Default 0 (0x00)

0x05E4 Speed

Use this TLV to modify the speed of recorded voice files.

This TLV is used for all file IDs in the *Play File Start* message and in the *Play File Modify* message when the Action field is set to Modify.

Byte	Description
0, 1	Tag 0x05E4 Speed
2, 3	Length 0x0002
4, 5	Value[0, 1] Speed, expressed in percent Allowable values: 50 (%) (0x32) 75 (%) (0x4B) 100 (%) (0x64) Default Value 200 (%) (0xC8) 300 (%) (0x12C) 400 (%) (0x190)

0x05E5 Barge In

Use this TLV in the *Play File Start* and *Resource Create* message to enable barge-in for recorded files or a conference broadcast.

Byte	Description
0, 1	Tag: 0x05E5 Barge In
2, 3	Length: 0x0001
4	Value[0]: Barge In Flag Bit 0 0 = Barge In Disabled (default for Play files) 1 = Barge In Enabled (default for conferencing (broadcast)) Bit 1-7 Reserved (should be set to 0x00)

0x05E6 File Event Descriptor

Use this TLV in the *Play File Start Record File Start* messages to configure the generation of Call Processing Events related to the playing and recording of files..

Byte	Description
0, 1	Tag: 0x05E6 File Event Descriptor
2, 3	Length: 0x0001
4	Value[0]: File Event Descriptor Mask Default = 0x00 Bit 0 If set, Call Processing Event of "Play File Completed" (0x2C) is generated when the file finishes playing. Bit 1 If set, Call Processing Event of "Play File Started" (0x2B) is generated when the file begins playing. Bit 2 If set, Call Processing Event of "Record File Completed" (0x2E) is generated when the file finishes recording. Bit 3 If set, Call Processing Event of "Record File Started" (0x2D) is generated when the file begins recording. Bits 4-7 Reserved (must be 0x00)

0x05E7 Playback Repeat

Use this TLV in the *Play File Start* message to specify the number of times to repeat playing a recorded voice file or list of files, as well as the interval between repetitions and the total time for playing the file.

Byte	Description
0, 1	Tag 0x05E7 Playback Repeat
2, 3	Length 0x0006
4, 5	Value[0, 1] Number of times to repeat playing the file or list of files. 0xFFFF = Repeat Forever
6, 7	Value[2, 3] Interval between repetitions (100 ms steps) 0x05 (Default for 500 ms)
8, 9	Value[4, 5] Total time file is played (100 ms steps) 0x0000 = Disable timer (Default)

10,11	<p>Value[6,7] Length of File Played</p> <p>The length of the play time must be greater than or equal to the File time multiplied by the number of times the file is repeated.</p> <p>Also expressed as the formula below:</p> $Pt \geq (Ft + Dt) \times R$ <p>If the length of the file being played (or Ft) is 30 seconds, and the Interval or Delay time (Dt) is 10 seconds, and you want to repeat (R) the file 3 times, the Total time the file is played (Pt) must be ≥ 110 seconds.</p> <p>If this formula is followed, the Interval time (default of 500ms) can be configured to be more.</p> <p>However, if the total time (Pt) is LESS than the combined total of Ft and Dt, multiplied by the number of repetitions desired, the interval will not configure past the default of 500ms.</p>
-------	---

0x05E8 Beep Tone Parameters

Use this TLV in the *Record File Start* message to enable Beep Tone, as well as its frequency, duration, and amplitude.

Byte	Description
0, 1	Tag 0x05E8 Beep Tone Parameters
2, 3	Length 0x0005
4	Value[0] Beep Enable Flag 0 Disable 1 Enable (Default)
5, 6	Value[1, 2] Beep Frequency (Hz) Minimum 100 (0x0064) Maximum 3000 (0x0BB8) Default 1000 (0x03E8)
7	Value[3] Beep Duration (10 ms steps) Minimum 3 (0x03) Maximum 200 (0xC8) Default 20 (0x14)
8	Value[4] Beep Amplitude, in decibel milliwatts (dBm) Minimum -54 (0xCA) Maximum 3 (0x03) Default -15 (0xF1)

0x05E9 Initial Silence Timer

Use this TLV in the *Record File Start* message to set the Initial Silence Timer.

Recording does not begin until voice is detected. If the Initial Silence Timer expires before voice is detected, the recording attempt is aborted. For example, if the default setting of 2500 milliseconds is used, the recording attempt is aborted if no voice is detected in the first 2500 milliseconds.

Byte	Description
0, 1	Tag 0x05E9 Initial Silence Timer
2, 3	Length 0x0002
4, 5	Value[0-1] Timer (10 ms increments) Minimum 1 (0x0001) Maximum 65534 (0xFFFE) Disable timer 65535 (0xFFFF) Default 250 (0x00FA)

0x05EA Final Silence Timer

Use this TLV in the *Record File Start* message to specify how much silence it takes at the end of a voice recording to trigger the card to stop recording.

Byte	Description
0, 1	Tag 0x05EA Final Silence Timer
2, 3	Length 0x0002
4, 5	Value[0-1] Timer (10 ms increments) Minimum 1 (0x0001) Maximum 65534 (0xFFFE) Disable timer 65535 (0xFFFF) Default 250 (0x00FA)

0x05EB Maximum Record Timer

Use this TLV in the *Record File Start message* to set the maximum length of time allowed for recording a message.

Byte	Description
0, 1	Tag 0x05EB Maximum Record Timer
2, 3	Length 0x0002
4, 5	Value[0-1] Timer (10 ms increments) Minimum 1 (0x0001) Maximum 65534 (0xFFFE) Disable timer 65535 (0xFFFF) (Default)

0x05EC Skip Steps

Use this TLV in the *Play File Modify* message when the Action field is set to Skip Forward or Skip Backward.

Byte	Description
0, 1	Tag 0x05EC Skip Steps
2, 3	Length 0x0002
4, 5	Value[0-1] Steps (100 ms increments) Minimum 1 (0x0001) Maximum 65534 (0xFFFFE) Start of File 0 (0x0000) End of File 65535 (0xFFFFF)

0x05ED Dual Channel Record Option

Use this TLV when recording a conference with the *Record File Start* message to choose whether you want each channel to be saved to its own file or both channels to be saved to the same file.

Byte	Description
0, 1	Tag 0x05ED Dual Channel Record Option
2, 3	Length 0x0001
4	Value[0] 0x00 Sum Channels Together (Default) 0x01 Independent Channels (file location is the same, but filename is appended with "_2")

0x05EF Alarm Threshold Configure

Each DSP Series 2 main board can store up to three hours of files in a local cache. Each parameter has a threshold that generates an alarm. The M and N values provide a filter. M samples out of N must exceed the threshold for an alarm to occur. Files are stored in one-second blocks.

Used in:
 Generic Card Configure
 Generic Card Query
 VoIP Protocol Configure
VoIP Protocol Query

Byte	Description
0, 1	Tag 0x05EF Alarm Threshold Configure
2, 3	Length 0x0008
4	Value[0] Alarm Number 0 (0x00) Number of Reads 1 (0x01) Total Bytes Read 2 (0x02) Average Read Delay 3 (0x03) Maximum Read Delay 4 (0x04) Number of Writes 5 (0x05) Total Bytes Written 6 (0x06) Average Write Delay 7 (0x07) Maximum Write Delay 8 (0x08) Maximum Simultaneous Files Opened 9 (0x09) Average Simultaneous Files Opened 10 (0x0A) CPU Idle Time 11 (0x0B) VRA Process Delay 12 (0x0C) VRA IO Queue Delay
5	Value[1] Severity 0x00 Minor 0x01 Major
6	Value[2] M Value (Hits in window) Minimum 1 (0x01) Maximum 16 (0x10) Default 3 (0x03)
7	Value[3] N Value (Samples in window) (N >= M) Minimum 1 (0x01) Maximum 16 (0x10) Default 5 (0x05)
8-11	Value[4-7] Threshold Value (if this is a time value, it is in microseconds)

0x05F0 DSP 2 Main Board Memory Alarm Threshold Configure

Use this TLV to set the threshold in percentage of total blocks used, on a per-card basis. If recorded voice files are accessed through a Network File Server, then this value represents only the Temporary Cache memory space. Files are stored in one-second blocks.

If recorded announcements are accessed through a Network File Server, then this represents only the Temporary Cache memory space.

For the DSP Series 2 card, this TLV is used in the *Generic Card Configure* message and in the response to the *Generic Card Query* message.

Byte	Description
0, 1	Tag 0x05F0 DSP 2 Main Board Memory Alarm Threshold Configure
2, 3	Length 0x0006
4	Value[0] Parameter ID 0x00 Total Blocks
5	Value[1] Disable/Enable 0x00 Disabled (default) 0x01 Enable
6-9	Value[2-5] Threshold Value 1-100 (represents a percentage of the total available blocks)

0x05F1 DSP Temporary Memory Alarm Threshold Configure

Use this TLV in the *Generic Card Configure* message to set the threshold in percentage of total blocks, and to disable the alarm. This is set on a per-card basis, and the same threshold is used for all DSPs that are configured for File Playback/Record on that DSP Series 2 card. Files are stored in one-second blocks.

Byte	Description
0, 1	Tag: 0x05F1- DSP Temporary Memory Alarm Threshold Configure
2, 3	Length: 0x0006
4	Value[0]: Parameter ID 0x00 - Total Blocks
5	Value[1:]: Disable/Enable 0x00 - Disable (default) 0x01 - Enable
6-9	Value[2-5]: Threshold Value 1-100 (represents a percentage of the total available blocks)

0x05F2 Play File Queue

Use this TLV in the *Play File Start* message (0x011B) to add a file to the Play File Queue. The TLV supports all file IDs, and it works with both the Channel AIB and the Conference AIB.

If File A is playing and has not completed before you send File B, File B interrupts File A. This TLV causes File B to wait in queue so that File A can finish.

Byte	Description
0, 1	Tag: 0x05F2 - Play File Queue
2, 3	Length: 0x0002
4, 5	Value[0] 0x00 - Queue (Default) 0x01 - Override

0x05F3 Vocabulary Index Read Information

This TLV is sent in the response to the *Generic Card Query* message. It indicates the number of files in the Vocabulary Index File (VIF) and checks the integrity of the VIF through a checksum.

Byte	Description
0, 1	Tag: 0x05F3 - Vocabulary Index Read Information
2, 3	Length: 0x0008
4-7	Value[0-3] - Number of files in the Index file
8-11	Value[4-7] - Vocabulary Index File checksum

0x05F4 Statistics Update Timer

Use this TLV in the *Generic Card Configure* message to set how often system statistics are updated.

Byte	Description
0, 1	Tag: 0x05F4 - Statistics Update Timer
2, 3	Length: 0x0002
4, 5	Value[0, 1] - Timer Value Minimum: 1 (0x0001) Maximum: 168 (0x00A8) Default: 24 (0x0018)

0x05F5 Fixed Memory Statistics

This TLV is reported in the response to the *Statistics Query* message. It includes the total, average, and maximum blocks of fixed memory used on a specific DSP chip. A history of these statistics is not maintained.

Byte	Description
0, 1	Tag: 0x05F5 - Fixed Memory Statistics
2, 3	Length: 0x0008
4	Value[0] Module Number 0x00 - DSP Module 0 0x01 - DSP Module 1 0xFF - Mainboard
5	Value[1] Processor Number 0x00 - 0x03 0x00 for processor on Main board
6, 7	Value[2, 3] Total Blocks
8, 9	Value[4, 5] Average Blocks Used
10, 11	Value[6, 7] Max Blocks Used

0x05F6 DSP Series 2 Cache Statistics

This TLV is included in the response to the *Statistics Query* message. It reports cache accesses, hits, and misses, as well as average free blocks for a specific DSP chip. The history of these statistics is kept.

Byte	Description
0, 1	Tag: 0x05F6 Cache Statistics
2, 3	Length: 0x0010
4	Value[0] Module Number 0x00 - DSP Module 0 0x01 - DSP Module 1 0xFF - Main board
5	Value[1]: Processor Number Valid Range - 0-3 0x00 for main board processor
6-9	Value[2-3]: Cache Accesses
10-13	Value[6-9]: Cache Misses
14-17	Value[10-13]: Cache Hits
18, 19	Value[14, 15]: Average Free Blocks

0x05F7 DSP Function Statistics

This TLV is included in the response to the *Statistics Query* message. It reports average free channels, minimum free channels, and total requests for each function on a specific DSP chip on a DSP module. This data is repeated for the Txmt0, Rcv0, Txmt1, and Rcv1.

Byte	Description
0, 1	Tag:0x05F7 - DSP Function Statistics
2, 3	Length: 0x000C
4	Value[0]: Module Number 0x00 - DSP Module 0 0x01 - DSP Module 1
5	Value[1]: Processor Number Valid Range - 0x00 - 0x03
6	Value[2]: Sub-DSP Section 0x00 - Receive 0 0x01 - Transmit 0 0x02 - Receive 1 0x03 - Transmit 1
7	Value[3]: Function Number
8-11	Value[4-7]:Total Requests for Function
12, 13	Value[8, 9]: Average Free Channels
14, 15	Value[10, 11]: Minimum Free Channels

0x05F8 NFS Statistics

This TLV is included in the response to the *Statistics Query* message. It reports a wide range of NFS statistics for a specific DSP chip.

Byte	Description
0, 1	Tag: 0x05F8 - NFS Statistics
2, 3	Length: 0x005C
4	Value[0] Module Number 0x00 - DSP Module 0 0x01 - DSP Module 1 0xFF - Main board
5	Value[1]: Processor Number Valid Range - 0x00 - 0x03 0x00 for main board processor
6-9	Value[2-5] :Total Reads
10-13	Value[6-9]: Total Size of Reads
14-17	Value[10-13]: Minimum Read Time Delay
18-21	Value[14-17]: Maximum Read Time Delay
22-25	Value[18-21]: Average Read Time Delay
26-29	Value[22-25]: Total Writes
30-33	Value[26-29]: Total Size of Writes
34-37	Value[30-33]: Minimum Write Time Delay

38-41	Value[34-37]: Maximum Write Time Delay
42-45	Value[38-41]: Average Write Time Delay
46-49	Value[42-45]: Total Opens
50-53	Value[46-49]: Total Size of Opens
54-57	Value[50-53]: Minimum Open Time Delay
58-61	Value[54-57]: Maximum Open Time Delay
62-65	Value[58-61]: Average Open Time Delay
66, 67	Value[62, 63]: Simultaneous Files Being Played from Cache
68, 69	Value[64, 65]: Max Simultaneous Files Being Played from Cache
70, 71	Value[66, 67]: Average Simultaneous Files Being Played from Cache
72, 73	Value[68, 69]: Simultaneous Files Playing & Filling the 8260 Cache
74, 75	Value[70, 71]: Maximum Simultaneous Files Playing & Filling 8260 Cache
76, 77	Value[72, 73]: Average Simultaneous Files Playing & Filling 8260 Cache
78, 79	Value[74, 75]: Simultaneous Files Being Played Directly from NFS
80, 81	Value[76, 77]: Maximum Simultaneous Files Being Played Directly from NFS
82, 83	Value[78, 79]: Average Simultaneous Files Being Played Directly from NFS
84, 85	Value[80, 81]: Simultaneous Files Being Written to 8260 Cache
86, 87	Value[82, 83]: Maximum Simultaneous Files Being Written to 8260 Cache
88, 89	Value[84, 85]: Average Simultaneous Files Being Written to 8260 Cache
90, 91	Value[86, 87]: Simultaneous Files Being Written to the NFS Server
92, 93	Value[88, 89]: Maximum Simultaneous Files Being Written to the NFS Server
94, 95	Value[90, 91]: Average Simultaneous Files Being Written to the NFS Server

0x05F9 Query Statistics

Use this TLV in the *Statistics Query* message to indicate the Query Type and Sample Number.

Byte	Description
0, 1	Tag: 0x05F9 - Query Statistics
2, 3	Length: 0x0004
4, 5	Value[0, 1] Query Type 0x0400 - DSP Function Statistics 0x0401 - NFS Statistics 0x0402 - Fixed Memory Statistics 0x0403 - DSP Series 2 Cache Statistics 0x0404 - Resource Point Statistics 0x0405 - CPU Statistics 0x0406 - DSP 2 Overload Statistics 0xFFFF - Returns all valid Queries for the entity queried.
6, 7	Value[2-3]: Sample Number 0x0000 - Current Working Buffer 0x0001- 0x0010 - Saved copies [N-1], N-2] . . . 0xFFFE - Instantaneous values of used and free channels 0xFFFF - A copy that is cleared every time it is read

0x05FA Card Object

Use this TLV in the *Generic Card Configure* message to identify the card to be configured. The card uses this information to verify that the message is intended for it.

Byte	Description
0, 1	Tag: 0x05FA - Card Object
2, 3	Length: 0x0004
4, 5	Value[0, 1]: Card Type ID Refer to the Card Population Query 0x0007 message for a list of the card types.
6, 7	Value[2, 3]: Object ID 0x0000 - General Card Configuration 0x0001 - Conferencing Parameters 0x0003 - Alarm Configuration (Used in <i>Generic Card Query</i> message only) 0x0004 - DSP Series 2 Fax Parameters Query 0x0005 - Echo Cancel 0x0006 - PVD/AMD Parameters 0x0007 - Dial Pulse Detection Parameters

0x05FB Silence Threshold

Use this TLV in the *Record File Start* to set the Silence Threshold. When the Beep Amplitude is reached, silence is no longer assumed.

Byte	Description
0, 1	Tag: 0x05FB - Silence Threshold
2, 3	Length: 0x0001
4	Value[0] Beep Amplitude, in decibel milliwatts (dBm) Minimum: -54 (0xCA) Maximum: 3 (0x03) Default: -25 (0xE7)

0x05FC Temporary Record File Timer

Use this TLV in the *Record File Start* message to set the maximum amount of time that an internal recording will stay in the cache before expiring. The timer runs on a per file basis.

Byte	Description
0, 1	Tag: 0x05FC - Temporary Record File Timer
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Timer Value, in seconds Minimum: 0 (0x0000) Maximum: 65535 (0xFFFF) Default: 30 (0x001E)

0x05FD CPU Statistics

This TLV may be included in the response to the *Statistics Query* message.

Byte	Description
0, 1	Tag: 0x05FD CPU Statistics
2, 3	Length: 0x0034
4	Value[0]: DSP Module
5	Value[1]: DSP Chip
6	Value[2]: Percentage Idle
7	Value[3]: Percentage of time in the kernel task
8	Value[4]: Percentage of time in servicing interrupts
9	Value[5]: Percentage of time in the tnettask task
10	Value[6]: Percentage of time in the tdspx task
11	Value[7]: Percentage of time in the tdspr task
12	Value[8]: Percentage of time in the tnet task
13	Value[9]: Percentage of time in the trac task
14	Value[10]: Percentage of time in the tvrap task
15	Value[11]: Total percentage of time
16-19	Value[12-15]: Number of ticks idle
20-23	Value[16-19]: Number of ticks in the kernel task
24-27	Value[20-23]: Number of ticks in servicing interrupts
28-31	Value[24-27]: Number of ticks in the tnettask task
32-35	Value[28-31]: Number of ticks in the tdspx task
36-39	Value[32-35]: Number of ticks in the tdspr task
40-43	Value[36-39]: Number of ticks in the tnettask task
44-47	Value[40-43]: Number of ticks in the trac task
48-51	Value[44-47]: Number of ticks in the tvrap task
52-55	Value[48-51]: Total ticks

0x05FE Resource Point Statistics

This TLV may be returned in the response to the *Statistics Query* message. Note: TLV 0x05F9, query type 0404 is only valid while addressing the CSP Matrix Series 3 Card slot to query Resource Points. It does not work, if you address the DSP Series 2 card slot to query Resource Points.

Byte	Description
0, 1	Tag: 0x05FE Resource Point Statistics
2, 3	Length: 0x0010
4-7	Value[0-3]:Points Configured
8-11	Value[4-7]: Points Available
12-15	Value[8-11]: Minimum Points Available
16-19	Value[12-15]: Average Points Available

0x05FF DSP Cache Modify Action

Use this TLV in the *DSP Cache Modify* message.

Byte	Description
0, 1	Tag: 0x05FF DSP Cache Modify Action
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Action 0x0000 - Clear Specific Cache (also requires one or more File ID TLVs) 0x0001 - Clear All Caches 0x0002 - Copy Specific Cache (also requires the File ID, File Format, and File Location TLVs)

0x0600 NFS User Group ID

Use this TLV in the *Generic Card Configure* message if you want to modify the default NFS User Group ID information. You should send this TLV at the same time you are configuring the card for NFS (along with the File Management Configure TLV).

Byte	Description
0, 1	Tag: 0x0600 - NFS User Group ID
2, 3	Length: Variable
4, 5	Value[0, 1]: User ID (Default is 2001)
6, 7	Value[2, 3]: Group ID (Default is 100)
8, 9	Value[4, 5]: Local Name Length
10 . . .	Value[6 . . .]: Local Name

0x0601 NFS Poll Retries

Use this TLV in the *Generic Card Configure* message to set the number of polls the NFS server can miss before being marked out of service.

Byte	Description
0, 1	Tag: 0x0601 - NFS Poll Retries
2, 3	Length: 0x0004
4, 5	Value[0, 1]: NFS Poll Retries: Default = 0x0001
6, 7	Value[2, 3]: NFS Read Retries: Default = 0x0001

0x0602 Resource Type

Use this TLV to identify the resource type in the following messages:

Resource Create (0x0124)

Resource Modify (0x0125)

Resource Delete (0x0126)

Resource Connect (0x0127)

Byte	Description
0, 1	Tag: 0x0602 - Resource Type
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Resource Type 0x0100 - Conference 0x0105 - Send Fax 0x0106 - Receive Fax 0x0107 - Child Conference 0x0108 - Echo Cancel 0x0109 - Positive Voice Detection/ Answering Machine Detection (PVD/AMD) 0x010A - Send SMS 0x010B - Receive SMS 0x010C - Send FSK 0x010D - Receive FSK

0x0603 Channel/DSP Pool

Use this TLV in the *Resource Create* (0x0124) message to indicate the available DSP resources for a conference..

Byte	Description
0, 1	Tag: 0x0603 - Channel/DSP Pool
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Conference Location 0x0000 - Local DSP/Local Channel 0x0001 - Local DSP/Any Channel 0x0002 - Any DSP/Any Channel

0x0604 DTMF Clamping/Filtering Enable

Use this TLV to enable DTMF Clamping/Filtering for a file or a conference.

Play File Start (0x011B) (when starting a file)

Record File Start (0x011E) (when starting a recording)

Play File Modify (0x011C) (play file in progress)

Record File Modify (0x011F) (record file in progress)

Resource Create (0x0124) (when creating a conference)

Resource Modify (0x0125) (existing conference /or when modifying channel parameters connected to conference or child conference)

Resource Connect (0x0127) (when connecting channels to conference/moving channels from parent to child conference)

Byte	Description
0, 1	Tag: 0x0604 - DTMF Clamping/Filtering Enable
2, 3	Length: 0x0002
4, 5	Value[0, 1]: DTMF Clamping Mode 0x0000 - Disabled (Default) 0x0001 - Enabled

0x0605 EXS Conferencing Encoding Type

Use this TLV in the *Resource Create* (0x0124) message to specify the encoding type for a conference over the EXNET® ring.

Byte	Description
0, 1	Tag: 0x0605 - EXS Conferencing Encoding Type
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Encoding Type 0x0000 - u-law 0x0001 - A-law 0x0002 - Mixed

0x0606 Monitor Conference Enable

Use this TLV in the *Resource Create* (0x0124) message to create a Monitor Conference.

Byte	Description
0, 1	Tag: 0x0606 - Monitor Conference Enable
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Encoding Type 0x0000 - Disabled (Default) 0x0001 - Enable Monitor Conference

0x0607 Output Gain Control

Use this TLV to set the output gain, in decibels, for a conference.

It is used in the in the following messages

Resource Create (0x0124)

Resource Modify (0x0125)

Resource Connect (0x0127) .

Byte	Description
0, 1	Tag: 0x0607 - Output Gain Control
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Output Gain (1 db steps) Minimum: -40 (0xFFD8) Maximum: 0 (0x0000) Default: 0 (0x0000)

0x0608 Noise Gating Enable

Use this TLV to enable and disable noise gating in a conference.

It is used in the following messages:

Resource Create (0x0124)

Resource Modify (0x0125)

Resource Connect (0x0127)

Byte	Description
0, 1	Tag:0x0608 Noise Gate Enable
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Noise Gating 0x0000 - Disabled (Default) 0x0001 - Enabled

0x0609 Noise Gate Parameters

Use this TLV in the *Resource Create* (0x0124) message to set parameters for gating noise, including:

- the time constant over which the noise level is checked
- the allowable noise level
- noise gating sensitivity

If noise gating sensitivity is set too low for a conference, there is a risk of clipped speech; if it is set too high, there is a risk of noise bleeding through.

Byte	Description
0, 1	Tag: 0x0609 - Noise Gate Parameters
2, 3	Length: 0x0006
4, 5	Value[0, 1]: Time Constant (5 ms steps) Min: 10 (0x000A) Max: 100 (0x0064) Default: 35 (0x0023)
6, 7	Value[2, 3]: Maximum Noise Level (1 dBm steps) Min: -54 (0xFFCA) Max: -10 (0xFFF6) Default: -20 (0xFFEC)
8, 9	Value[4, 5]: Noise Gating Sensitivity 0x0001 - Low 0x0002 0x0003- Default 0x0004 0x0005 - High

0x060A Echo Suppression Enable

Use this TLV to enable and disable echo suppression in a conference.

It is used in the following messages

Resource Create (0x0124)

Resource Modify (0x0125)

Resource Connect (0x0127)

Byte	Description
0, 1	Tag: 0x060A Echo Suppression Enable
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Echo Suppression 0x0000 - Disabled (Default) 0x0001 - Enable

0x060B Echo Suppression Parameters

Use this TLV in the *Resource Create* (0x0124) message to set decibel parameters for suppressing echo in conferences. The higher quality the network, the lower you can set these parameters.

Byte	Description
0, 1	Tag: 0x060B Echo Suppression Parameters
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Echo Return Loss (1 db steps) Min: -54 (0xFFCA) Max: -6 (0xFFFA) Default: -10 (0xFF6)

0x060C Automatic Gain Control Enable

Use this TLV to enable and disable Automatic Gain Control.

It is used in the following messages

Resource Create (0x0124)

Resource Modify (0x0125)

Resource Connect (0x0127)

Byte	Description
0, 1	Tag: 0x060C Automatic Gain Control Enable
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Automatic Gain Control 0x0000 - Disable (Default) 0x0001 - Enable

0x060D Automatic Gain Control Input Level

Use this TLV in the *Resource Create* message (0x0124) to set the target input level in conferences.

Byte	Description
0, 1	Tag: 0x060D Automatic Gain Control Input Level
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Input Level (1 dBm steps) Min: -54 (0xFFCA) Max: -3 (0xFFFF) Default: -22 (0xFFEA)

0x060E Automatic Gain Control Parameters

Use this TLV in the *Resource Create* message (0x0124) to set the time constant over which gain is measured in a conference.

Byte	Description
0, 1	Tag: 0x060E Automatic Gain Control Parameters
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Time Constant (5 ms steps) Min: 100 (0x0064) Max: 20000 (0x4E20) Default: 2000 (0x07D0)

0x060F Conference Failure Behavior

Use this TLV in the *Resource Connect* message (0x0127) to choose whether a channel is purged or parked when a conference fails.

Byte	Description
0, 1	Tag: 0x060F Conference Failure Behavior
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Conference Failure Behavior 0x0000 - Purge Channel (Default) 0x0001 - Park Channel

0x0610 Conference ID

This TLV is included in the response to the *Resource Create* message (0x0124) to identify a conference.

Byte	Description
0, 1	Tag: 0x0610 Conference ID
2, 3	Length: 0x0004
4-7	Value[0-3]: Conference ID Bits 0-9: Local Conference ID Bit 10: Conference Type 0 - Normal 1 - Monitor Bits (15,11): Node ID Bits (31,16): Reserved

0x0611 Forced Flag

Use this TLV in the *Resource Delete* message (0x0126) to choose whether a conference is deleted forcefully or gracefully.

Byte	Description
0, 1	Tag: 0x0611 Forced Flag
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Forced Flag 0x0000 - Graceful Delete 0x0001 - Forced Delete

0x0612 Connection Type

Use this TLV in the *Connect with Data* (0x0005) message to set up a one-way connection that is maintained during a matrix switchover. Do not use in the *Connect* (0x0000) message.

Use this TLV in the *Resource Connect* (0x0127) message to specify the connection type for a conferee.

Used in:

0x1E Generic PPL ICB in:

Connect with Data message

Resource Connect message

Byte	Description
0, 1	Tag: 0x0612 Connection Type
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Connection Type 0x0000 - 2-Way Connect (Default) 0x0001 - 1-Way Connect 0x0002 - 1-way Connect (Talk only)

0x0613 Conference Size

Use this TLV in the *Resource Create* (0x0124) message to specify the size of the conference.

Byte	Description
0, 1	Tag: 0x0613 Conference Size
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Conference Size 0x0002-0x0080

0x0614 Offset and Length

Use this TLV in the *Play File Start* message (0x011B) to begin playing a file at an offset from the beginning of the file, and to specify how long into the file to play so it doesn't have to play to the end.

Because the Offset and Length are in bytes, and because they represent bytes in a file, the application is responsible for managing the different encoding formats, and for how bytes should represent time.

You can use this TLV when queueing files, but you cannot use it when chaining files within a single message.

Byte	Description
0, 1	Tag: 0x0614 Offset and Length
2, 3	Length: 0x0008
4-7	Value[0-3]: Offset (bytes from the start of the file)
8-11	Value[4-7]: Length (bytes from the offset to play)

0x0615 Append or Replace

Use this TLV in the *Record File Start* message (0x011E) to specify whether to append to a file or to completely replace the file.

You can set the “File Not Found” behavior so that if you attempt to append to a file that is not found, you can create a new file or fail the open command.

The Append or Replace TLV is ignored for temporary records, which are always replaced. It is also ignored when copying a temporary record to a file.

Byte	Description
0, 1	Tag: 0x0615 Append or Replace
2, 3	Length: 0x0002
4	Append or Replace File 0 - Replace 1 - Append
5	“File Not Found” Behavior 0 - Fail the Open Command 1 - Create a New File

0x0616 DSP Series 2 Overload Statistics

This TLV is included in the response to the *Statistics Query* message (0x0121), in response to a DSP Overload Statistics query.

Byte	Description
0, 1	Tag: 0x0616 DSP Series 2 Overload Statistics
2, 3	Length: 0x001D
4	Value[0]: DSP Series 2 Module
5	Value[1]: DSP Chip
6-9	Value[2-5]: VRA Process Delay Process Time of Cached Play Files, in microseconds
10-13	Value[6-9]: Maximum VRA Process Delay Maximum Process Time of Cached Play Files, in microseconds.
14-17	Value[10-13]: Average VRA Process Delay Average Process Time of Cached Play Files, in microseconds.

18-21	Value[14-17]: VRA IO Queue Delay Process Time of Non-Cached Play and Record Files in microseconds.
22-25	Value[18-21]: Maximum VRA IO Queue Delay Maximum Process Time of Non-Cached Play and Record Files, in microseconds.
26-29	Value[22-25]: Average VRA IO Queue Delay Average Process Time of Non-Cached Play and Record Files, in microseconds.
30	Value[26]: Percent CPU Idle
31	Value[27]: Minimum Percent CPU Idle Time
32	Value[28]: Average Percent CPU Idle Time

0x0617 Alarm Threshold Query

Use this TLV in the *Generic Card Query* message (0x0123) to query the Alarm Threshold on the DSP Series 2 card.

Byte	Description
0, 1	Tag: 0x0617 Alarm Threshold Query
2, 3	Length: 0x0001
4	Value[0]: Alarm Number Being Queried 0x00 - 0x0F 0xFF - Request a Bit Mask of Enabled Alarms

0x0618 Alarm Threshold Enabled Report

Use this TLV in the *Generic Card Query* message (0x0123).

Byte	Description
0, 1	Tag: 0x0618 Alarm Threshold Enabled Report
2, 3	Length: 0x0008
4 - 7	Value[0-3]: A Bit Mask of Level 1 Alarms Enabled on this Card
8-11	Value[4-7]: A Bit Mask of Level 2 Alarms Enabled on this Card

0x0619 PVD Parameters

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Positive Voice Detection.

Byte	Description
0, 1	Tag: 0x0619 - PVD Parameters
2, 3	Length: 0x0006
4, 5	Value[0, 1]: Time Constant Min. = 10 (0x000A) Max. = 100 (0x0064) Default = 35 (0x0023)
6, 7	Value[2, 3]: Maximum Noise Level (1db steps) Min. = -54 (0xFFCA) Max. = -10(0xFFFF6) Default = -20 (0xFFEC)
8, 9	Value[4, 5]: Noise Gating Sensitivity 0x0001 Low 0x0002 0x0003 Default 0x0004 0x0005 High

0x0620 AMD Parameters

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Positive Voice Detection/Answering Machine Detection.

Byte	Description
0, 1	Tag: 0x0620 - AMD Parameters
2, 3	Length: 0x0016
4, 5	Value[0, 1]: Frequency Band 1 Minimum Detection Frequency (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 350 (0x015E) DISABLE = 0
6, 7	Value[2, 3]: Frequency Band 1 Maximum Detection Frequency 1 (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 350 (0x015E) DISABLE = 0
8, 9	Value[4, 5]: Frequency Band 2 Minimum Detection Frequency (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 750 (0x02EE) DISABLE = 0

10, 11	Value[6, 7]: Frequency Band 2 Maximum Detection Frequency (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 1600 (0x0640) DISABLE = 0
12, 13	Value[8, 9]: Frequency Band 3 Minimum Detection Frequency (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 1700 (0x06A4) DISABLE = 0
14, 15	Value[10, 11]: Frequency Band 3 Maximum Detection Frequency (Hz) Min = 200 (0x00C8) Max = 3000 (0x0BB8) Default = 3000 (0x0BB8) DISABLE = 0
16, 17	Value[12, 13]: Minimum Tone on time for declaration of tone present (10 ms) Min = 2 (0x0002) Max = 3000 (0x0BB8) Default = 15 (0x000F) DISABLE = 0
18, 19	Value[14, 15]: Minimum Tone on time for declaration of tone not present (10 ms) Min = 2 (0x0002) Max = 3000 (0x0BB8) Default = 15 (0x000F) DISABLE = 0
20, 21	Value[16, 17]: Minimum level of tone to declare present dBm Min = -54 (0xFFCA) Max = 3 (0x0003) Default = -20 (0xFFEC) DISABLE = 0
22, 23	Value[18, 19]: Minimum Voice on time for declaration of AMD_VOICE present (10 ms) Min = 2 (0x0002) Max = 3000 (0x0BB8) Default = 15 (0x000F) DISABLE = 0
24, 25	Value[20, 21]: Minimum Voice off time for declaration of AMD_VOICE Not present (10 ms) Min = 2 (0x0002) Max = 3000 (0x0BB8) Default = 15 (0x000F) DISABLE = 0

0x061B AMD Reports

Byte	Description
0, 1	Tag: 0x061B - AMD Reports
2, 3	Length: 0x0002
4, 5	Value[0, 1]: Bitmask Set a bit location to enable CPE reports. All enabled by default 0x000F. 0x0001 - Silence 0x0002 - PVD 0x0004 - Tones 0x0008 - AMD

0x061C Server State

This TLV is included in the response of the *Generic Card Query* (0x0123) message in response to a DSP Series 2 General Card Configuration.

Byte	Description
0, 1	Tag: 0x061C - Server State
2, 3	Length: 0x0003
4, 5 6	Value[0]: Server ID (Application Defined) Value[1]: Server State 0x01 - Server is configured 0x02 - Server is connected 0x03 - Server is trying to connect 0x04 - Server is disconnected 0x05 - Server is disconnected urgent

0x0640 Matrix/Host Sequence Number Size

Use this TLV in the *Generic Card Configure* (0x0122) message to set the Matrix/Host Sequence Number Size.

Byte	Description
0, 1	Tag: 0x0640 - Matrix/Host Sequence Number Size
2, 3	Length: 0x0001
4	Value[0]: Sequence Number Size 0x00 - 8-Bit (Default) 0x01 - 16-Bit

0x0641 Header Parameter Format

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to set the Header Parameter Format..

Byte	Description
0, 1	Tag: 0x0641 - Header Parameter Format
2, 3	Length: Variable
4	Value[0] Format 0x00 - Insert 0x01 - Overlay 0x02 - Replace (Default)
5	Value[1]: Format String Length
6-nn	Value[2-n]: Format String Default: " %D %T Remote ID: %R page %P of %M" Note: %D : insert date %T : insert time %L : insert local fax ID %R : insert remote fax ID %P : insert current page number %M : insert total page count (available for transmission header only)

Example:

If your string is "Excel%D%T" your output could be:

Excel 12/15/04, 3:42 PM

0x0642 T.30 Control Parameter Max Value

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to set the T.30 Control Parameter Max. Value.

Byte	Description
0, 1	Tag: 0x0642 T.30 Control Parameter Max Value
2, 3	Length: 0x0002
4, 5	Value[0,1]: Maximum rate permitted for fax operation. Limits advertised or selected transmission rates. 0x0000 - 2400 bps 0x0001 - 4800 bps 0x0002 - 7200 bps 0x0003 - 9600 bps 0x0004 - 12000 bps 0x0005 - 14400 bps (Default)

0x0643 T.30 Control Parameter Transmit Level

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to set the T.30 Control Parameter Transmit Level.

Byte	Description
0, 1	Tag: 0x0643 T.30 Control Parameter Transmit Level
2, 3	Length: 0x0002
4, 5	Value[0,1]: Transmission Level in tenths of dbm -400 to 0dbm. Min -400 (0xFE70) Max 0 Default -135 (0xFF79)

0x0644 T.30 Control Parameter ECM Enabled

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to enable T.30 Control Parameter ECM.

Byte	Description
0, 1	Tag: 0x0644 T.30 Control Parameter ECM Enable
2, 3	Length: 0x0002
4, 5	Value[0,1]: ECM 0x0000 - Disabled (Default) 0x0001 - Enabled

0x0645 T.30 Control Parameter Local Session ID

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to set the T.30 Control Parameter Local Session ID.

Byte	Description
0, 1	Tag: 0x0645 T.30 Control Parameter Local Session ID
2, 3	Length: Variable (max. 20)
4-n	Value[0-n]: D to be used as the local ID for the session " " (Default)

0x0647 Receive Modem Type

Use this TLV in the *Generic Card Configure* (0x0122) message to set the Receive Modem Type.

Byte	Description
0, 1	Tag: 0x0647 Receive Modem Type
2, 3	Length: 0x0002
4, 5	Value[0-1]: Modems to advertise in the DIS 0x0001 V27 0x0002 V29 0x0008 V17 0x000B (V.29, V.27, V.17) default

0x0648 Receive Resolution Type

Use this TLV in the *Generic Card Configure* (0x0122) message to set the Receive Resolution Type.

Byte	Description
0, 1	Tag: 0x0648 Receive Resolution Type
2, 3	Length: 0x0002
4, 5	Value[0-1]: Resolutions to advertise in the DIS (bitmask) 0x0004 RES_204x98 0x0008 RES_204x196 0x0010 RES_204x391 0x0020 RES_408x391 0x0040 RES_200x200 0x0080 RES_300x300 0x0100 RES_400x400 0x01FC (default)

0x0649 Receive Encoding Type

Used in: *Generic Card Configure* (0x0122) and *Generic Card Query* (0x0123) messages.

Byte	Description
0, 1	Tag: 0x0649 Receive Encoding Type
2, 3	Length: 0x0002
4, 5	Value[0,1]: Encodings to Advertise in the DIS (bitmask) 0x0001 MH (T.4, 1-D base mode) 0x0002 MR (T.4, 2-D encoded) 0x0003 MMR (T.6 encoding) (Default)

0x064B Receive Bad Line

Use this TLV in the *Generic Card Configure* (0x0122) and *Resource Connect* (0x0127) messages to set the action to take for the placement of bad lines in an image.

Byte	Description
0, 1	Tag: 0x064B Receive Bad Line
2, 3	Length: 0x0002
4, 5	Value[0,1]: Action to take for placement of bad lines in the image 0x0000 Do Nothing 0x0001 Repeat Last Good Line (Default) 0x0002 Blank Line with Tic Marks on Each Side 0x0003 Blank Line

0x064C Receive Page Size

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127) and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag: 0x064C Receive Page Size
2, 3	Length: 0x0002
4, 5	Value[0,1]: Page Sizes to Advertise 0x0001 - ISO A4 (210mm x 297mm) 0x0002 - JIS B4 (257mm x 364mm) 0x0004 - ISO A3 (297mm x 420mm) 0x0007 - (A4+B4+A3) (Default)

0x0651 Receive Enable ECM

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag: 0x0651 Receive Enable ECM
2, 3	Length: 0x0002
4, 5	Value[0,1]: Enable Error Correction Mode 0x0000 No (Default) 0x0001 Yes

0x0652 Receive Add Header

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages. (Not supported in the current release.)

Byte	Description
0, 1	Tag: 0x0652 Receive Add Header
2, 3	Length: 0x0002
4, 5	Value[0,1]: Receive Add Header 0x0000 - Disable (Default) 0x0001 - Enable

0x0654 Receive Line Error Threshold

Used in: *Generic Card Configure* (0x0122) and *Generic Card Query* (0x0123) messages.

Byte	Description
0, 1	Tag: 0x0654 Receive line error threshold
2, 3	Length: 0x0002
4, 5	Value[0,1]: Percentage of line in error that forces an RTN 0-100 (Default = 10)

0x0655 Receive Timeout

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag: 0x0655 Receive Timeout
2, 3	Length: 0x0004
4-7	Value[0-3]: Length of T1, in milliseconds. Normally 35000. 35000 (Default)

0x0657 Receive Terminal ID

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag: 0x0657 Receive Terminal ID
2, 3	Length: Variable (Max 20)
4-nn	Value[0]: Terminal ID String (Default: “ ”)

0x065A Transmit Modem Type

Used in: *Generic Card Configure* (0x0122) and *Generic Card Query* (0x0123) messages.

Byte	Description
0, 1	Tag: 0x065A Transmit Modem Type
2, 3	Length: 0x0002
4, 5	Value[0,1]: Modems to Use (bitmask) 0x01 V27 0x02 V29 0x08 V17 0x0b (V27+V29+V17) (Default)

0x065B Transmit Resolution Type

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag: 0x065B Transmit Resolution Type
2, 3	Length: 0x0002
4, 5	Value[0,1]: Resolutions to advertise in the DIS (Bit Mask) 0x0001 - RES 75 x75 0x0002 - RES 150 x150 0x0004 - RES 204 x98 0x0008 - RES 204 x196 0x0010 - RES 204 x391(default) 0x0020 - RES 408 x391 0x0040 - RES 200 x200 0x0080 - RES 300 x300 0x0100 - RES 400 x400 0x0200 - RES 600 x600

0x065C Transmit Page Size

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag 0x065C Transmit Page Size
2, 3	Length 0x0002
4, 5	Value[0,1] Page Size to Support (Bit Mask) 0x0001 ISO A4 (210mm x 297mm) 0x0002 JIS B4 (257mm x 364mm) 0x0004 ISO A3 (297mm x 420mm) 0x0008 ISO A6 (864pels on 107mm or 1728pels on 107mm) 0x0010 ISO A5 (1216pels on 151mm) 0x0020 Letter 0x0040 Legal 0x0007 A4+B4+A3 (Default)

0x0661 Transmit Enable ECM

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag 0x0661 Transmit Enable ECM
2, 3	Length 0x0002
4, 5	Value[0,1] Enable Error Correction Mode 0x0000 No (Default) 0x0001 Yes

0x0662 Transmit Add Header

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages. (Not supported in the current release.)

Byte	Description
0, 1	Tag 0x0662 Transmit Add Header
2, 3	Length 0x0002
4, 5	Value[0,1] Enable Transmit Header 0x0000 No 0x0001 Yes (Default)

0x0664 Transmit Enable CNG

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag 0x0664 Transmit Enable CNG
2, 3	Length 0x0002
4, 5	Value[0,1] Enable CNG Generation 0x0000 No 0x0001 Yes (Default)

0x0666 Transmit Timeout

Used in: *Generic Card Configure* (0x0122) and *Generic Card Query* (0x0123) messages.

Byte	Description
0, 1	Tag 0x0666 Transmit Timeout
2, 3	Length 0x0004
4-7	Value[0-3] Length of T1 in milliseconds Time in milliseconds (Default = 35000)

0x0668 Transmit dbm Level

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages. (Not supported in the current release.)

Byte	Description
0, 1	Tag 0x0668 Transmit dbm Level
2, 3	Length 0x0002
4, 5	Value[0,1] dbm level for G.711 transmission in tenths of dbm. -400 to 0dbm. Min -400 (0xFE70) Max 0 Default -135 (0xFF79)

0x066A Transmit Terminal ID

Used in: *Generic Card Configure* (0x0122), *Generic Card Query* (0x0123), *Resource Connect* (0x0127), and *Resource Query* (0x012C) messages.

Byte	Description
0, 1	Tag 0x066A Transmit Terminal ID
2, 3	Length Variable (max 20)
4-nn	Value[0] Terminal ID String (Default: " ")

0x066C Fax Processing Events Set Register

Used in: *Generic Card Configure* (0x0122) and *Generic Card Query* (0x0123) messages.

Byte	Description
0, 1	Tag 0x066C Fax Processing Events Set Register
2, 3	Length 0x0002
4, 5	Value[0,1] Register Event Set (bitmask) (see details below) 0x0001 Phase A fax processing events 0x0002 Phase B fax processing events 0x0004 Phase C fax processing events 0x0008 Phase D fax processing events 0x0010 Phase E fax processing events 0x0020 Timer Events 0x0040 Data pump Events

0x066D Fax Configuration Query Type

Use this TLV in the *Generic Card Query* message with the Object Type of DSP 2 Fax Query.

Byte	Description
0, 1	Tag 0x066D Fax Configuration Query Type
2, 3	Length 0x0002
4, 5	Value[0, 1] Query Type 0x0001 - T.30 control parameters 0x0002 - Receive parameters 0x0004 - Transmit parameters

0x0673 Echo Cancel Tap Length

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0673
2, 3	Length: 0x0002
4, 5	Value [0,1] Tap Length This is the length of the echo to be removed. Tail Length of the echo canceller FIR filter in number of samples. Allowed Options (8 samples = 1 millisecond) 0x0040 (64) = 8ms 0x0080 (128) = 16ms 0x0100 (256) = 32ms 0x0200 (512) = 64ms 0x0400 (1024) = 128ms

0x0674 Echo Cancel NLP Type

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0674
2, 3	Length: 0x0001
4	Value [0] NLP Type This enables/disables the Non Linear Processor and, when the NLP is enabled, sets the type of Comfort Noise Generator used. 0x00 = Off 0x01 = On 0x02 = Random Noise CNG 0x03 = Hoth Noise CNG 0x04 = Maximum Suppression

0x0675 Echo Cancel ADAPT

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0675
2, 3	Length: 0x0001
4	Value [0] This enables/disables the FIR filter coefficient adaptation. 0x00 = Disable 0x01 = Enable

0x0676 Echo Cancel Bypass

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0676
2, 3	Length: 0x0001
4	Value [0] Bypass Enable 0x00 = Normal Operation; 0x01 = Bypass the echo canceller 0x02 = Bypass the echo canceller but still adapt its internal states and coefficients.

0x0677 Echo Cancel G.176 Modem Answer Detection

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0677
2, 3	Length: 0x0001
4	Value [0] Enable/Disable 0x00 = Disabled 0x01 = Enable

0x0678 Echo Cancel NLP Threshold

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0678
2, 3	Length: 0x0002
4	Value [0] Nonlinear processor threshold -32767 to +32767 (negative in 2's complement) Negative number indicates less aggressive NLP. Formula: $32767 * 10^{(-dB)/20}$ dB = value you enter

0x0679 Echo Cancel CNG Noise Threshold

Use this TLV in the *Generic Card Configure* message to set card-level parameters for Echo Cancel.

Byte	Description
0, 1	Tag: 0x0679
2, 3	Length: 0x0002
4	Value [0] CNG Noise Threshold Maximum near end noise level used to compute CNG level 0 to 32767 Formula: $32767 * 10^{(dBm-3)/20}$ dB = value you enter

0x067A Echo Cancel H Register Reset

Use this TLV in the *Resource Modify* message to reset the Echo Cancel Receiver.

Byte	Description
0, 1	Tag: 0x067A
2, 3	Length: 0x0001
4	Value [0] 0x00 = Disable 0x01 = Enable

0x067E Echo Cancel Comfort Noise Level

Use this TLV in the *Resource Connect* message to add comfort noise to RTP/ASR.

Byte	Description
0, 1	Tag: 0x067E
2, 3	Length: 0x0002
4, 5	Value [0, 1] 0x0000 - 0x0059 Default - 0x0032 This value determines the initial level of the comfort noise. The higher this value is, the lower the added noise is. Dialogic does not recommend values 0x0000 - 0x001E.

0x0687 - Enable RTP for Play/Record File

Use this TLV to enable RTP for Play/Record File in the following messages:

- *Play File Start*
- *Record File Start*

Byte	Description
0, 1	Tag: 0x0687 - Enable RTP for Play/Record File
2, 3	Length: 0x0001
4	Value [0] 0x00 - Disable 0x01 - Enable

0x0688 - RTP Record Mode

Use this TLV to set the RTP Record Mode in the following messages:

Play File Start

Record File Start

Byte	Description
0, 1	Tag: 0x0688 - RTP Record Mode
2, 3	Length: 0x0001
4	Value [0] 0x00 - Continuous Recording (default) Recording controlled with <i>Record File Start</i> and <i>Record File Stop</i> messages 0x01 - Recording with PVD RTP packets will only be sent during the time that Positive Voice is detected. Use in conjunction with: 0x0689 - Start/Stop Sending RTP Packets 0x068A - Calendar Time Offset for Sending RTP Packets

0x0689 - Start/Stop Sending RTP Packets

Use this TLV in the *Record File Modify* message to start or stop the sending of RTP packets with Positive Voice Detection.

To use this TLV, you must have previously sent a *Record File Start* message with the 0x0688 - RTP Record Mode TLV with the mode set to 0x01 - Recording with PVD.

Byte	Description
0, 1	Tag: 0x0689 - Start/Stop Sending RTP Packets
2, 3	Length: 0x0001
4	0x00 - Stop 0x01 - Start

0x068A - Calendar Time Offset for Sending RTP Packets

Use this TLV in the *Record File Modify* message to indicate the time at which positive voice is detected. The host will be notified with a Call Processing Event message.

To use this TLV, you must have previously sent a *Record File Start* message with the 0x0688 - RTP Record Mode TLV with the mode set to 0x01 - Recording with PVD.

This TLV is used with the Start/Stop Sending RTP Packets TLV (0x0689) in the *Record File Modify* Message.

Byte	Description
0, 1	Tag: 0x0689 - Calendar Time Offset for Sending RTP Packets
2, 3	Length: 0x0006
4-7	Calendar Time Offset (seconds since Jan. 1, 1970)
8, 9	Milliseconds

0x068B Input Gain Control

Use this TLV with the Channel AIB in the following messages to set the input gain, in decibels, for a conferee.

- *Resource Create* (0x0124)
- *Resource Modify* (0x0125)
- *Resource Connect* (0x0127)

Byte	Description
0, 1	Tag: 0x068B Input Gain Control
2, 3	Length: 0x0002
4-5	Input Gain (in 1 db increments) Min -40 (0xFFD8) Max +10 (0x000A) Default 0 (0x0000)

0x068C FAX Page Range

Use this TLV in the *Resource Connect* (0x0127) message to specify a page range for FAX transmission.

- To FAX a single page, enter same page number for Start Page and End Page.
- If the page range specified extends beyond the end of the TIFF file, the file will be transmitted to completion from the specified start page.

- If the specified start page is beyond the end of the TIFF file, then a Fax complete event shall be generated and no pages shall be transmitted.

Byte	Description
0, 1	Tag: 0x068C FAX Page Range
2, 3	Length: 0x0004
4, 5	Start Page Default = 0x01
6, 7	End Page Default = End of File

0x068D Transit Connection Mode

Use this TLV with the DSP Chip AIB in the following message to set the conference one-way (input only) temporarily, while the tone/file is being played.

- *Resource Create* (0x0124)
- *Resource Connect* (0x0127)

Byte	Description
0, 1	Tag: 0x068D Transit Connection Mode
2, 3	Length: 0x0002
4-5	Value [0,1] conference leg connection behavior while transmitting tone/file 0x0000: Remove leg (Default) 0x0001: Connect Input Only

0x0690 Frequency Shift Keying (FSK) Data

Use this TLV in the *Outseize Control* message.

Byte	Description
0, 1	Tag: 0x0690 Frequency Shift Keying (FSK) Data
2, 3	Length (variable): 0xnxxx
4, 5	Value[0, 1]: Data Type 0x0000 - ASCII Character 0x0001 - BCD Digit Pair 0x0002 - Raw Data
6, 7	Data Length (variable): 0xnxxx
8	Value[0]: Data 1 1st ASCII Character or 1st BCD Digit Pair
9	Value[0]: Data 2 2nd ASCII Character or 2nd BCD Digit Pair
nn	Value[0]: Data 1 nth ASCII Character or nth BCD Digit Pair

0x0691 Terminal Equipment Alerting Signal (TAS)

Use this TLV in the *Outseize Control* message.

Byte	Description
0, 1	Tag: 0x0691 Terminal Equipment Alerting Signal (TAS)
2, 3	Length (variable): 0x0002
4, 5	Value[0, 1]: Signal Type 0x0000 - DT-AS

0x0692 Subscriber Alerting Signal (SAS)

Use this TLV in the *Outseize Control* message.

Byte	Description
0, 1	Tag: 0x0692 Subscriber Alerting Signal (SAS)
2, 3	Length (variable): 0x0002
4, 5	Value[0, 1]: Signal Type 0x0000 - Call Waiting Tone

0x0693 FSK Data Transmission Type

Use this TLV in the *Outsize Control* message.

Byte	Description
0, 1	Tag: 0x0693 FSK Data Transmission Type
2, 3	Length (variable): 0x0002
4, 5	Value[0,1]: Data Transmission Type 0x0000 - FSK Transmission During Ringing 0x0001 - FSK Transmission Prior to Ringing 0x0000 - FSK Transmission without Ringing

0x0694 Short Message Service (SMS) Data

Use this TLV in the *Outsize Control* message.

Byte	Description
0, 1	Tag: 0x0694 Short Message Service (SMS) Data
2, 3	Length (variable): 0xnxxx
4	Value[0]: Message Type 0x01 - DLL_SMS_Data 0x02 - DLL_SMS_Error 0x03 - DLL_SMS_EST 0x04 - DLL_SMS_REL 0x05 - DLL_SMS_ACK 0x06 - DLL_SMS_NACK
5	Message Length (variable): 0xnn
6, nn	Value[0]: Payload

0x0695 FSK Modem Type

Use this TLV in the *Outsize Control* message.

Byte	Description
0, 1	Tag: 0x0695 FSK Modem Type
2, 3	Length (variable): 0x0002
4, 5	Value[0,1]: Data Transmission Type 0x0000 - ITU V.23 (default) 0x0001 - Bell 202 0x0002 - Bell 202 Chinese

0x0750 Dial Pulse Detection Parameters

Use this TLV in the *Generic Card Configure* and *Generic Card Query* messages.

Byte	Description
0, 1	Tag: 0x0750 - Dial Pulse Detection Parameters
2, 3	Length: 0x000A
4, 5	Value[0, 1]: Low Threshold Level - The sample level required to be below in order to declare sample as a Low Signal Default - 0x1388 (5000)
6, 7	Value[2, 3]: Low Threshold Count - The number of consecutive low samples to be considered a post Dial Pulse Low Default - 0x0011 (17)
8, 9	Value[4, 5]: Peak Threshold - The sample value required for a signal to be declared a Dial Pulse Peak Default - 0x36B0 (14000)
10, 11	Value[6, 7]: Maximum Transition Count - The maximum low to high transition time (samples). For a peak to be declared, the ramp time has to be less than this number of samples. Default - 0x7530 (30000)
12, 13	Value[8, 9]: Settle By Count: Number of consecutive samples that the signal must be below the low threshold to declare the signal as a dial pulse. Default - 0x0190 (400)

0x0751 - Play Continue On Digit Detection

The *Play File Start* (0x011B) supports the following new TLV.

Important! This TLV is not applicable for Play File message to conferences or child conferences.

Used in:

Play File Start (0x011B)

Byte	Description
0, 1	Tag 0x0751
2, 3	Length 0x0002
4	Value[0-3] 0 - Cancel on digit detection (default) 1 - Continue play on digit detection

0x09CA Add Global Title Group

This TLV is used to add a new Global Title (GT) group. It automatically activates the newly configured entries. After that, all GT entries that were pending to be added are brought into service. All GT entries that

were pending to be deleted are brought out of service and internal entry space becomes available for subsequent configurations. The index table is rebuilt automatically.

Used in:

SS7 SCCP TCAP Configure message

Byte	Description
0, 1	Tag 0x09CA Add Global Title Group
2, 3	Length 0x0009
4	Value[0] 0-127 Group ID
5	Value[1] Global Title Indicator 1-4 for ITU 1-2 for ANSI
6	Value [2] Translation Type 0-255 (0 = Default)
7	Value [3] Numbering Plan 0-15 (0 = Default)
8	Value [4] Nature of Address Indicator (NAI) 1-127 (0 = Default)
9	Value [5] Minimum Digits 1-24 The minimum number of digits that the GT entry of this group will contain. Must be greater than 0 and less than or equal to the Maximum Digits field.
10	Value [6] Maximum Digits 1-24 The maximum number of digits that the GT entry of this group will contain. Must be less than 24 and greater than or equal to the Minimum Digits field.

11	<p>Value [7] Group Attribute</p> <p>Bit 0 Maximum match 0 = Use minimum match rule for this group 1 = Use maximum match rule (also known as best match rule) for this group.</p> <p>Bit 1 UMTS CG (Not used in current release.) 0 = Calling Party address will not be changed when the Global Title translation results in "Route on GT." 1 = Calling Party address is changed when GT translation results in "Route on GT." The new calling party address is stored in SSN default parameter table. The UMTS CG bit will not take effect for connection oriented messages.</p> <p>Bit 2 ANSI TT4 0 = Not TT4 type 1 = TT4 type If this bit is set, no GT entry can be added into this group.</p> <p>Bit 3 Remove GT 0 = Do not remove GT after a successful translation. 1 = Remove GT after a successful translation.</p>
12	Reserved for future use.

0x09CB Delete Global Title Group

When you delete a group, all Global Title (GT) entries belonging to this group are removed. This TLV automatically activates the newly configured entries. After that, all GT entries that were pending to be added in are brought into service. All GT entries that were pending to be deleted are brought out of service and internal entry space becomes available for subsequent configurations. The index table is rebuilt automatically.

Used in:
SS7 SCCP TCAP Configure message

Byte	Description
0, 1	Tag 0x09CB Delete Global Title Group
2, 3	Length 0x0006

4	Value[0]	Group ID 1-127
5	Value [1]	Global Title Indicator 1-15
6	Value [2]	Translation Type 0-255 (0- Default)
7	Value [3]	Numbering Plan (NP) 0-15 (0 - Default)
8	Value [4]	Nature of Address Indicator (NAI) 1-127 (0 - Default)
9	Reserved for future use.	

0x09CC Add Global Title Entry

This TLV is used to add Global Title (GT) entries. It is not used for Global Title Translation (GTT) immediately. You can configure multiple GT entries before you activate them using the 0x09CE Build Index Table.

These newly configured GT entries are stored on the SS7 card but do not take effect until the SS7 card receives the Build Index command.

You can add 1,000 GT entries at a time up to a maximum of 100,000 for an SS7 card. If you configure GT entries after exceeding this maximum, you will receive the error code 0x552D. When the GT entry has been in the Active GT table you will receive the error code 0x5529. When the GT entry has been Standby GT table you will receive the error code 0x5528.

Used in:

Table 4-2 Translation Result Format

Byte	Field Name	Description
N	Translation Result Length	
N+1	Translation Result Format	Four formats: 00: RI + PC 01: RI+PC+SSN 02: RI+PC+GT 03: RI+PC+SSN+GT
N+2	Routing Indicator	00: Route on GT 01: Route on SSN
N+3 - N+6	Point Code	
If (N+1)Byte=0x01 RI+PC+SSN		
N+7	Subsystem Number	
If (N+1) Byte = 0x02 RI+PC+GT		
N+7	Global Title	See Table 4-3 below.
If (N+1) Byte=0x03 RI+PC+SSN+GT		
N+7	Subsystem Number	
N+8 - ...	Global Title	See Table 4-3 below.

Table 4-3 Global Title Format

Byte	Field	Description
N	GTI	Global Title Indicator Range: 1-15
N+1	GT Content Length	Range: 1-24
N+2	GT Content	Global Title Content

0x09CD Delete Global Title Entry

After the deleted Global Title (GT) Entry TLV is executed, the deleted GT Entry is not out of service immediately. It is used to do GTT until the index table is built which remove these GT entries from the GT table.

Used in:

SS7 SCCP TCAP Configure message

Byte	Description
0, 1	Tag 0x09CD Delete Global Title Entry
2, 3	Length Variable
4	Value[0] Group ID 1-127 Already configured.
5	Value [1] Entry Attribute (ATT) Bit 0 - Wild Card bit 0 = Non-Wild Card GT 1 = Wild Card GT Bits 1-7 Not Used.
6	Reserved for future use.
7	Value [2] Global Title Address Information Length 1-24 digits
:	Value [n] Global Title Address Information (GTAI) See Table 4-1 for format.

0x09CE Build Index Table

This TLV is used to activate configured GT entries. After the index table is built, all new added GT entries are in service and all deleted GT entries are out-of-service.

This TLV automatically activates the newly configured entries. After that, all GT entries that were pending to be added are brought into service. All GT entries that were pending to be deleted are brought out of service and internal entry space becomes available for subsequent configuration.

Used in:
SS7 SCCP TCAP Configure message

Byte	Description
0, 1	Tag 0x09CE Build Index Table
2, 3	Length 0x0001
4	Value[0] 1 - Build Index All other values reserved for future use.

0x09CF Global Title Group Query

Use this query type to query a Global Title (GT) Group.

Used in:
SS7 SCCP/TCAP Query message

Byte	Description
0, 1	Tag 0x09CF Global Title Group Query
2, 3	Length 0x0001
4	Value[0] Group ID 0-127

0x09D0 Global Title Entry Query

Use this query type to query a Global Title (GT) Entry.

Used in:
SS7 SCCP/TCAP Query message

Byte	Description
0, 1	Tag 0x09D0 Global Title Entry Query

2, 3	Length	0x0001
4	Value[0]	Group ID 0-127
5	Value[1]	GT Attribute Bit 0 - Wildcard bit 0 Non-wildcard GT 1 Wildcard GT Bits 1-7 Not Used.
6	Reserved for future use.	
7	Value[2]	Global Title Address Information Length 1-24 digits
:	Value[n]	Global Title Address Information (GTAI) See Table 4-1.

0x09D1 Global Title Group Query Response

Used in:

SS7 SCCP/TCAP Query message

Byte	Description	
0, 1	Tag	0x09D1 Global Title Group Query Response
2, 3	Length	0x0009 Note: If you attempt to query either a Global Title Group that does not exist, the TLV length in the response will be one byte consisting of null data.
4	Value[0]	State 0 Group Idle 1 Group In Service
5	Value[1]	Stack ID -State this group belongs to.
6	Value[2]	GTI GT Indicator

7	Value[3]	TT	Translation Type
8	Value[4]	NP	Numbering Plan
9	Value[5]	NAI	Nature of Address Indicator
10	Value[6]	Minimum Digits - The minimum number of digits the GT Entry of this group contains	
11	Value[7]	Maximum Digits - The maximum number of digits the GT Entry of this group contains	
12	Value[8]	<p>Group Attribute</p> <p>Bit 0 - Maximum Match 0 Use minimum match rule for this group 1 Use the maximum match rule for this group (best match rule).</p> <p>Bit 1 - UMTS CG (Not used in current release.) 0 Calling Party address will not be changed when GT translation results are "Route on GT." 1 Calling Party address is changed when GT translation results are "Route on GT." The new calling party address is stored in SSN default parameter table.</p> <p>Bit 2 - ANSI TT4 0 Not TT4 Type 1 TT4 Type If this bit is set, no GT entry can be added to this group.</p> <p>Bit 3 - Remove GT 0 Do not remove GT after a successful translation. 1 Remove GT after a successful translation.</p>	

0x09D2 Global Title Entry Query Response

Used in:

SS7 SCCP/TCAP Query message

Byte	Description
0, 1	Tag 0x09D2 Global Title Entry Query Response
2, 3	Length Variable Note: If you attempt to query either a Global Title Entry that does not exist, the TLV length in the response will be one byte consisting of null data.
4	Value[0] State 0 = Idle 1 = In service 2 = Pending_Add 3 = Pending_Del
5	Value[1] Translation Result Option
6	Value[2] Translation Result 1 See Table Translation Result Format
7	Value[3] Translation Result 2 (If it exists.) See Table Translation Result Format .

0x2710 Universal Protocol Data, Single

Use this TLV to specify the universal protocol data.

Used in:

PPL Table Download message

Byte	Description
0, 1	Tag 0x2710
2	Value[0] Data Format (See Note 1)
3	Value[1] Offset (See Note 3)
4-7	Value[2-5] Reserved
:	Value[:] Universal Protocol Data (See Note 2)
:	Value[:] Mask (See Note 2)

0x2710 Universal Protocol Data, Range

Use this TLV to specify the universal protocol data.

Used in:

PPL Table Download message

Byte	Description
0, 1	Tag 0x2710
2	Value[0] Data Format (See Note 1)
3	Value[1] Offset (See Note 3)
4-7	Value[2-5] Reserved
:	Value[:] To Universal Protocol Data (See Note 2)
:	Value[:] From Universal Protocol Data (See Note 2)
:	Value[:] Mask (See Note 2)

0x2712 Congestion Level (Interworking Only)

Used in:

NPDI Universal ICB (0x0033)

Byte	Description
0, 1	Tag 0x2712
2, 3	Length 0x0002
4	Value[0] Congestion Level 0x0000 Receiver ready 0x0001 Congestion level 1 exceeded 0x0002 Congestion level 2 exceeded 0x000F Receiver not ready

0x2716 Call Identity (Interworking Only)

Used in:

NPDI Universal ICB (0x0033)

Byte	Description
0, 1	Tag 0x2716
2, 3	Length Variable
4-6	Value[0] SS7 Point Code
7,8	Value[1] Number of Call Identity Bytes
9	Value[2] Call Identity

0x2717 Called Party Number

Use this TLV to specify the called party number. This TLV and be used in Interworking and Standard environments.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x2717
2, 3	Length Variable
4	Value[0] Type of Number
5	Value[1] Numbering Plan Identifier and Reverse Charge Indicator
6	Value[2] Number of Digits (N)
7	Value[3] BCD Digit Pair 1
:	Value[4] BCD Digit Pair 2
:	Value[(N+1)/2] Half as many BCD pairs as digits.

0x2718 Calling Party Number (Connected Number)

Use this TLV to specify the calling party number. This TLV can be used in both Interworking and Standard environments.

The Screening and Presentation Indication byte and Numbering Plan Identifier byte are SS7 Called Party Number and Calling Party Number parameters defined in ANSI T1.113 and ITU Q.763.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x2718
2, 3	Length Variable
4	Value[0] Type of Number
5	Value[1] Screening and Presentation Indication

6	Numbering Plan Identifier
7	Calling Party Category
8	Number of Digits (N)
9	BCD Digit Pair 1
:	BCD Digit Pair 2
:	:

**0x271A Circuit State
(Interworking Only)**

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x271A
2, 3	Length Variable
4	Value[0] Coding Standard 0x00 CCITT Standardized Coding 0x01 ISO/IEC Standard 0x02 National Standard 0x03 Standard specific to identified location
5, 6	Value[1] Circuit State 0x0000 IDLE 0x0001 Locally blocked 0x0002 Remotely blocked 0x0003 Locally and remotely blocked 0x0004 Circuit incoming busy 0x0005 Circuit outgoing busy 0x0006 Locally blocked by hardware 0x0007 Remotely blocked by hardware 0x0008 Locally and remotely blocked by hardware All other values are reserved.

**0x271B Cause Indicators
(Interworking Only)**

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x271B
2, 3	Length Variable
4	Value[0] Coding Standard

5	Value[1] Location
6	Value[2] Cause Value
7,8	Value[3] Length of Diagnostics
9	Value[4] Diagnostics Data 1
10	Value[5] Diagnostics Data 2
11	Value[6] Diagnostics Data [...]

0x2725 Forward Call Indicators (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2725
2, 3	Length Variable
4-8	Value[0] First byte indicator Bit 1 - Incoming International Call Indicator 0 Not an incoming international call 1 Incoming international call Bit 2 - End-to-End Method Indicator 00 No end-to-end method available 01 Pass along method available 10 SCCP Method available 11 Pass along and SCCP method available Bit 3 - Interworking Indicator 0 No interworking encountered (SS7 all the way) 1 Interworking encountered Bit 4 - IAM Segmentation Indicator 0 No indication 1 Additional information sent in an unsolicited information message Bit 5 - ISUP Indicator 0 ISUP not used all the way 1 ISUP used all the way Bit 6 - ISUP Preference Indicator 00 ISUP Preferred all the way 01 ISUP not required all the way 10 ISUP required all the way 11 Spare
5	Value[1] Second byte indicator Bit 1 - ISDN Access Indicator 0 Originating access non-ISDN 1 Originating access ISDN Bits 2-3 - SCCP Method Indicator 00 No indication 01 Connectionless method available 10 Connection oriented method available 11 Connectionless and connection oriented method available Bit 4 - Spare Bits 5-8 - Reserved for National Use

0x2727 Generic Digit Information (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2727
2, 3	Length Variable
4	Value[0] Acknowledgement Indicator 0x00 No ending acknowledgement required. 0x01 Ending acknowledgement required. 0xF0 to 0xFD User Defined 0xFF Not set or Unknown All the other values are reserved.
:	:
:	Value[1] Number of Digits
:	Value[2] Digit 12 in BCD pair
:	Value[3] Digit 34 in BCD pair

0x2729 Generic Number (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2729
2, 3	Length Variable
4	Value[0] Number qualifier
5	Value[1] Type of number
6	Value[2] Screening and presentation indication
7	Value[3] Number plan identifier
8	Value[4] Calling Party Category)
9	Value[5] Number of Digits
10	Value[6] BCD Digit Pair 1
11	Value [7]BCD Digit Pair 2
:	:

0x272A Generic Reference Number (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x272A
2, 3	Length Variable
4	Value[0] Reference MSB, LSB
:	:
:	Value[n] Reference MSB, LSB

0x272B Hop Counter (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x272B
2, 3	Length Variable
4	Value[0] Hop Counter Bits 1-5 Hop Counter Bits 6-8 Spare

0x2737 Original Called Number (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2737
2, 3	Length Variable
4	Value[0] Type of Number
6	Value[1] Screening and Presentation Indicators
7	Value[2] Numbering plan indicator
8	Value[3] Calling Party Category
9	Value[4] Number of digits
10	Value[5] BCD digit pair 1
11	Value[6] BCD digit pair 2
:	:

0x273C Redirecting Number (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x273C
2, 3	Length Variable
4	Value[0] Type of Number
5	Value[1] Redirection Reason
6	Value[2] Screening and Presentation Indicators
7	Value[3] Reverse charge and numbering plan indicator
8	Value[4] Category
9	Value[5] Number of digits
10	Value[5] BCD digit pair 1
11	Value[6] BCD digit pair 2
:	:

0x273D Redirection Information (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x273D
2, 3	Length Variable
4	Value[0] Type of Number
5	Value[1] Redirecting indicator / original redirection reason
6	Value[2] Redirection counter / redirection reason

0x273E Redirection Number (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x273E
2, 3	Length Variable
4	Value[0] Type of Number
5	Value[1] Redirection indicator / original redirection reason
6	Value[2] Redirection counter / redirection reason

**0x2745 Transit Network Selection
(Interworking Only)**

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2745
2, 3	Length Variable
4	Value[0] Type of network 0x00 CCITT standardized identification 0x02 National network 0x03 International network 0x04 User specified The rest of the values are reserved.
	Value[1] Network identification plan 0x00 Unknown 0x01 Carrier identification code 0x03 Data network identification code 0x06 Land mobile network identification code The rest of the values are reserved.

**0x2749 Bearer Capability
(Interworking Only)**

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2749
2, 3	Length Variable
4	Value[0] First byte of Q.931 Bearer Capability

0x274E NPDI Message Type

Use this TLV in the NPDI Universal ICB (0x0033) to indicate the message type. Most protocols require that you use the Message Type as the first TLV in the ICB. This TLV can be used in Interworking and Standard environments.

Used in:

NPDI Universal ICB (0x0033)

*Request for Service with Data message, Route Control message
Outseize Control message, Channel Released with Data message*

2, 3	Length 0x0004
4, 5	Value[0, 1] 0x0000 (Do not change)
6, 7	Value[2, 3] RTP Port

0x27AF NPDI SIP Fax Mode

Use this TLV in the following messages:

- *Outseize Control* (0x002C) and *Route Control* (0x00E8)
Host managed outseize control and route control. Use as a mandatory TLV in this message.
- *PPL Table Download* (0x00D6)
Use as a L4-Router TLV in this message.

- *Route Control (0x00E8)*
L4 managed route control. Use as an optional TLV in this message.

Byte	Description
0,1	Tag 0x27AF NPDI SIP Fax Mode
2,3	Length 0x0001
4	Value[0] 00=Disabled 01= Initiate T.38 re-INVITE 02= Initiate Bypass (PCM) re-INVITE

0x27B0 RTP Payload Type

Use this TLV in the NPDI Universal ICB (0x0033) to configure the RTP Payload Type.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Outseize Control message

Important! Do not confuse this TLV with 0x0100, which is the regular resource attribute TLV for RTP Payload Type. TLV 0x27B0 is the RTP Payload Type in NPDI format.

Byte	Description
0, 1	Tag 0x27B0 RTP Payload Type

0x27B1 RTP Payload Size

Use this TLV in the NPDI Universal ICB (0x0033) to configure the RTP Payload Size.

By changing the multiple of the payload size, you can configure how much encoded PCM data a packet contains.

Example: For G.711 on the VDAC-ONE card, a 160-byte payload of encoded PCM data is sent at the G.711 Basic Packet Rate of every 20 milliseconds. But if you change the multiple for G.711 to 2x, then a 320-byte payload is sent every 40 milliseconds.

In effect, changing the multiple also changes the throughput available over an Ethernet network. Larger packets create greater network delay overall, but they use the Ethernet bandwidth more efficiently. Smaller packets may use the Ethernet bandwidth less efficiently, but they may provide better voice quality.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Outseize Control message

Important! Do not confuse this TLV with 0x0101 which is the regular resource attribute TLV for RTP Payload Size. Tag 0x27B1 is the RTP Payload Size in NPDI format.

Byte	Description
0, 1	Tag: RTP Payload Size (0x27B1)
2, 3	Length: 0x0002
4	Value [0] Direction 0x00 Ingress 0x01 Egress
5	Value [1]: Multiple of the Basic Packet Rate (Default = 0x01)

0x27B2 NPDI RTP Silence Suppression

The RTP Silence Suppression TLV block enables and disables silence suppression.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Outseize Control message

Do not confuse this TLV with Tag 0x0102 which is the regular resource attribute TLV for Silence Suppression. Tag 0x27B2 is the RTP Silence Suppression in NPDI format.

Byte	Description
0, 1	Tag NPDI RTP Silence Suppression (0x27B2)
2, 3	Length 0x0001
4	Value[0] 0x00 Disable (Default) 0x01 Enable

0x27B3 NPDI RTP Connection Mode

This TLV block allows you to set the connection mode. A line can be connected to receive only, transmit only, or both.

Used in:
0x0033 NPDI Universal ICB in:
Route Control message
Outseize Control message

Do not confuse this TLV with TLV 0x01DB, which is the regular resource attribute TLV for RTP Connection Mode. Tag 0x27B3 is the RTP Connection Mode in NPDI format.

Byte	Description
0, 1	Tag: NPDI RTP Connection Mode (0x27B3)
2, 3	Length: 0x0001
4	Value[0] 0x00 Two-way connection 0x01 One-way listen/receive only 0x02 One-way talk/transmit only 0x03 Hold Mode

0x27B4 IP Address Criteria

Used in:
0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag IP Address Criteria (0x27B4)
2, 3	Length 0x0004
4. . .	Value IP Address

0x27C1 IP Signaling Series 3 Card ID

Used in:

0x0033 NPDI Universal ICB in:

Outsize Control message

Route Control message

Byte	Description
0, 1	Tag IP Signaling Series 3 card (0x27C1)
2, 3	Length 0x0002
4, 5	Value 0x0000 - 0x003F

0x27C2 Remote End Signaling IP Address (Q.931)

This TLV includes the IP address of the remote end with respect to the IP Signaling card. For inbound calls, this IP address is for the originator of the call. For outbound calls, this IP address is for the destination end point.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message

Route Control message

Byte	Description
0, 1	Tag Remote End Signaling IP Address (0x27C2)
2, 3	Length 0x0004
4-7	Value IP Address

0x27C3 Remote End Signaling Port (Q.931)

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Byte	Description
0, 1	Tag Remote End Signaling Port (0x27C3)
2, 3	Length Variable
4 . . .	Value Variable If the Remote End Signaling Port is not specified, the default value is 1720.

0x27C4 Source IP

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Source IP (0x27C4)
2, 3	Length 0x04
4. . .	Value Variable

0x27C5 Source Port

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Source Port (0x27C5)
2, 3	Length Variable
4. . .	Value Variable

0x27C9 Charge Area Information Parameter

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x27C9
2, 3	Length Variable
4	Value[1] Number of Digits
5	Value[2] First pair of CBD digits
6	Value[3] Second pair of BCD digits
7	Value[3] Third pair of BCD digits

0x27CA Carrier Information Parameter (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x27CA
2, 3	Length Variable
4	Value[1] Carrier Information Name 11111011 Calling Carrier Information 11111100 Called Carrier Information
5	Value[2] Carrier Information Parameter 11111110 Carrier Identification Code
6	Value[3] Number of Digits
7	Value[4] First pair of CBD digits
8	Value[5] Second pair of BCD digits
9	Value[6] Third pair of BCD digits
10	Remainder of Raw SS7 Parameters Not currently used.

0x27CB Non-Presentation Reason (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x27CB
2, 3	Length Variable
4	Value[1] Non-presentation Reason This parameter is required for KDDI and the CLIP/CLIR service. 0x01 Unnoticed because of user rejection 0x02 Unnoticed because of conflicting services 0x03 Unnoticed because of public telephone call

0x27D0 Partial Calling Line Identity (Interworking Only)

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x27D0
2, 3	Length Variable
4	Value[0] Type of Switch (BCD) Bits 1-4 (tens digit) Bits 5-8 (units digit)
5	Value[1] PNO Identity (BCD) Bits 1-4 (hundreds digit) Bits 5-8 (tens digit)
6	Value[2] Bits 1-4 PNO identity (BCD) (units digit) Bits 5-8 Switch Number (BCD) (hundreds digit)
7	Value[3] Switch Number (BCD) Bits 1-4 (tens digit) Bits 5-7 (units digit)

0x27D8 Source H.323 ID

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message

Route Control message

Byte	Description
0, 1	Tag Source H.323 ID (0x27D8)
2, 3	Length Variable
4. . .	Value Source H.323 ID (IA5/ASCII NULL terminated characters.)

0x27D9 Source URL

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message

Route Control message

Byte	Description
0, 1	Tag Source H.323 ID (0x27D9)
2, 3	Length Variable
4. . .	Value Variable

0x27DA Source E-mail

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Source Email (0x27DA)
2, 3	Length Variable
4. . .	Value Variable

0x27DC Remote H.323 ID

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Remote H.323 ID (0x27DC)
2, 3	Length Variable
4. . .	Value Variable

0x27DD Remote URL

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Remote URL (0x27DD)
2, 3	Length Variable
4. . .	Value Variable

0x27DE Remote E-mail

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message*Route Control* message

Byte	Description
0, 1	Tag Remote Email (0x27DE)
2, 3	Length Variable
4. . .	Value Variable

0x27E3 Release Cause Code

The following release cause codes are used for H.323 calls.

Used in:

0x0033 NPDI Universal ICB in:

Channel Released message

Channel Released with Data message

Byte	Description
0, 1	Tag Release Cause Code (0x27E3)
2, 3	Length 0x02
4,5	<p>Value[0]</p> <p>MSB 0x01 Release Reason LSB 0x01 Called Party Not Registered 0x02 Invalid Permission Chosen 0x03 Request Denied 0x04 Undefined Reason 0x05 Caller Not Registered 0x06 Route Call to Gatekeeper 0x07 Invalid Endpoint Identifier Chosen 0x08 Resource Unavailable Chosen 0x09 Security Denial Chosen 0x0A Control Not Supported Chosen 0x0B Complete Address Chosen 0x0C Release Complete Undefined Reason Chosen</p> <p>MSB 0x02 Release Reason Remote End LSB 0x01 No Bandwidth Chosen 0x02 Gatekeeper 0x03 Unreachable Destination Rejection Chosen 0x04 Destination Rejection Chosen 0x05 Release Complete Invalid Revision Chosen 0x06 No Permission Chosen 0x07 Unreachable Gatekeeper Chosen 0x08 Gateway Resources Chosen 0x09 Bad Format Address Chosen 0x0A Adaptive Busy Chosen 0x0B In Conf Chosen 0x0C Release Complete Undefined Reason Chosen 0x0D Facility Call Deflection 0x0E Security Denied Chosen 0x0F Release Complete Called Party Not Registered Chosen 0x10 Release Complete Caller Not Registered Chosen</p> <p>MSB 0x03 Release Reason Others LSB 0x01 Outsize Error 0x02 Protocol Error 0x03 Socket Open Fail 0x04 Gatekeeper not Configured 0x05 ARQ Fail 0x06 Purge 0x07 Local End Release</p> <p>MSB 0x04 Q931 Cause Location USER LSB Q931 Cause code</p> <p>MSB 0x05 Q931 Cause Location Private Network serving Local user LSB Q931 Cause code</p> <p>MSB 0x06 Q931 Cause Location Public Network serving Local user LSB Q931 Cause code</p> <p>MSB 0x07 Q931 Cause Location Transit Network LSB Q931 Cause code</p>

0x27E4 H.245 Outbound Tunneling

Used in:

Route Control message

Outseize Control message

You can send this TLV in the messages above for each H.323 outbound call initialization (on a per call basis) to configure H.245 tunneling for outbound calls.

This TLV has no effect unless the H.225 Tunneling Configure TLV (0x02D5) is enabled for inbound calls. The IP Signaling card can only use H.245 tunneling if inbound tunneling is enabled.

Byte	Description
0, 1	Tag 0x27E4
2, 3	Length 0x0001
4-7	Value[0-3] 0 - Disabled (default) 1 - Enabled

0x290E NPDI SIP Proxy IP Address

Use this TLV to specify the IP address of the SIP proxy server to which the request is sent. In an outbound call, this TLV specifies where the SIP Messages are sent. The information goes in the request URI of the SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Byte	Description
0, 1	Tag 0x290E
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x290F NPDI SIP Proxy Port

Use this TLV to specify the port number of the SIP proxy server to which the request is sent. In an outbound call, this TLV specifies where the SIP Messages are sent. The information goes in the request URI of the SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Byte	Description
0, 1	Tag 0x290F
2, 3	Length 0x0004
4-7	Value [0] Variable If this TLV is not present, the configured local port is used in outbound calls (<i>Route Control</i> message) and port 5060 is used for incoming calls for registration (Request for Service and PPL Indication).

0x2910 NPDI SIP Route Type

Use this TLV to specify whether or not a SIP message should be sent to the default proxy. The TLV is used only when the host does not specify the proxy address in the *Route Control* message and the default proxy is desired for a particular call. Absence of this TLV implies that the destination can be reached directly.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Byte	Description
0, 1	Tag 0x2910
2, 3	Length 0x01
:	Value 0x00 Direct Route Destination can be reached directly. Do not use default proxy. 0x01 Indirect Route Destination cannot be reached directly. Use default proxy if one is configured.

0x2914 NPDI SIP Local Lookup

Use this TLV to enable or disable local registration lookup for an individual call.

Used in:
 0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag 0x2914
2, 3	Length 0x0001
4	Value 0x00 Disabled 0x01 Enabled

0x2915 NPDI SIP Response Code

This TLV provides the response code received for any SIP message generated by the CSP.

Used in:
 0x0033 NPDI Universal ICB in:
Channel Released with Data message
Release Channel with Data message
PPL Event Indication message
Request for Service with Data message

Byte	Description
0, 1	Tag 0x2915
2, 3	Length 0x0002
4, 5	Value SIP Response Code (2 Bytes) This TLV, when reported in the PPL Event Indication for Event (0x0027/0x0028), will have any valid SIP Response value. The response code to be interpreted for event 0x0027 is as follows: 202 - Accepted (The REFER request is successful) 405 – Method Not Allowed (REFER request failed) 408 – Request Timed Out (REFER request failed) The response code to be interpreted for event 0x0028 is as follows: 100 – Trying 200 - OK (The reference is successful) 503 - Service Unavailable (The reference failed) 603 - Decline (The reference failed)

0x2916 SIP A Leg Transport Type

Reports to the host the default transport type of the A leg portion of the call.

Used in:
 0x0033 NPDI Universal ICB in:
Request for Service with Data message

Byte	Description
0, 1	Tag 0x2916
2, 3	Length 0x0001
:	Value 1 UDP 2 TCP

0x2917 SIP B Leg Transport Type

Reports or sets the default transport type on a per call basis. You set up the default value in the *VoIP Protocol Configure* message with the SIP Transport Type TLV.

Used in:
 0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag 0x2917
2, 3	Length 0x0001
:	Value 1 UDP 2 TCP

0x2919 NPDI SIP To Username

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the “To” header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the remote User Agent’s addressing information, which would be used to create the “To” header for the outgoing SIP message. Use this TLV to specify a username in the “To” header.

Used in:

0x0033 NPDI Universal ICB in:

Outseize Control message

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x2919
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x291A NPDI SIP To Password

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the “To” header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the remote User Agent’s addressing information, which would be used to create the “To” header for the outgoing SIP message.

Use this TLV to specify a password in the “To” header.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x291A
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x291B NPDI SIP To Host Name

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the “To” header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the remote User Agent’s addressing information, which would be used to create the “To” header for the outgoing SIP message.

Use this TLV to specify an IP address in the “To” header

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x291B
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x291C NPDI SIP To Port

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the “To” header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the remote User Agent’s addressing information, which would be used to create the “To” header for the outgoing SIP message.

This TLV provides the port from the “To” address URL.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x291C
2, 3	Length 0x0004
4-7	Value Variable If this TLV is not present, a default value of 5060 is used.

0x291E NPDI SIP Refer to Username

Use this TLV in a *PPL Event Request* message that is used to generate a REFER message. This TLV specifies the referred target User Agent’s addressing information which is used to create the Refer-To header for the outbound REFER request. Use this TLV to specify a username in the Refer-To header.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message

Byte	Description
0, 1	Tag 0x291E
2, 3	Length Variable
:	Value[0] A NULL-terminated ASCII string

0x291F NPDI SIP Refer to Password

Use this TLV in a *PPL Event Request* message that is used to generate a REFER message. This TLV specifies the referred target User Agent's addressing information which is used to create the Refer-To header for the outbound REFER request. Use this TLV to specify a password in the Refer-To header.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message

Byte	Description
0, 1	Tag 0x291F
2, 3	Length Variable
:	Value[0] A NULL-terminated ASCII string

0x2920 NPDI SIP Refer to Host Name

Use this TLV in a *PPL Event Request* message that is used to generate a REFER message. This TLV specifies the referred target User Agent's addressing information which is used to create the Refer-To header for the outbound REFER request. Use this TLV to specify a host IP address in the Refer-To header.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message

Byte	Description
0, 1	Tag 0x2920
2, 3	Length Variable
:	Value[0] A NULL-terminated ASCII string

0x2921 NPDI SIP Refer to Port

Use this TLV in a *PPL Event Request* message that is used to generate a REFER message. This TLV specifies the referred target User Agent's addressing information which is used to create the Refer-To header for the outbound REFER request. Use this TLV to specify the port in the Refer-To header.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message

Byte	Description
0, 1	Tag 0x2921
2, 3	Length 0x0004
:	Value[0] If this TLV is not present, the default 5060 is used.

0x2922 SIP REFER-To Header Param

This TLV contains the Refer-To Parameter in the Refer-To Header field:

Used in:

PPL Event Request message

PPL Event Indication message

Byte	Description
0, 1	Tag 0x2922
2,3	Length Variable (Maximum 250 bytes)
4-n	Value[0] A null-terminated ASCII string

- The data in the TLV 0x2922 is up to the interpretation of the host. The SIP stack does no masking/unmasking.
- If the TLV 0x2922 is present in the PPL ER for REFER then the host should have provided the '>' in the TLV data itself. If the host does not provide it then it is assumed to be at the end by the SIP stack.

0x2923 NPDI SIP From User Name

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the "From" header field of the incoming SIP message (for example INVITE or REGISTER). This

TLV could be used in a *Route Control* message to specify the local User Agent's addressing information, which would be used to create the "From" header for the outgoing SIP message.

Use this TLV to specify a user name in the "From" header.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x2923
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x2924 NPDI SIP From Password

In an *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the "From" header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the local User Agent's addressing information, which would be used to create the "From" header for the outgoing SIP message.

Use this TLV to specify a password in the "From" header.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Byte	Description
0, 1	Tag 0x2924
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x2925 NPDI SIP From Host Name

In an *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the "From" header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the local User Agent's addressing information, which would be used to create the "From" header for the outgoing SIP message.

Use this TLV to specify an IP address in the “From” header.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Request for Service message

Byte	Description
0, 1	Tag 0x2925
2, 3	Length Variable
:	Value A Null-terminated ASCII string

0x2926 NPDI SIP From Port

In a *Request for Service* message and PPL Event Indication, this TLV provides information parsed from the “From” header field of the incoming SIP message (for example INVITE or REGISTER). This TLV could be used in a *Route Control* message to specify the local User Agent’s addressing information, which would be used to create the “From” header for the outgoing SIP message.

This TLV provides the port from the “From” URL.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2926
2, 3	Length 0x0004
4-7	Value Variable If this TLV is not present, the configured local port is used in outbound calls (Route Control message) and port 5060 is used for incoming calls for registration (Request for Service and PPL Indication).

0x2928 SIP From Display Name

This TLV contains the user name parsed from the display name in ASCII format.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x2928
2, 3	Length Variable (Maximum of 250 bytes)
4-n	Value A Null-terminated ASCII string containing From Display Name

0x2929 - SIP Referred By Header URI TLV

This TLV does the following:

- Instructs the CSP SIP stack to insert Referred-By header in the outbound REFER. In case no data is provided CSP SIP stack fills in the contact URI.
- Reports the URI in the Referred-By header, if present, in the received REFER or INVITE request.
- Writes the URI of the Referred-By header in the outbound INVITE request.

Used in:

Route Control

Outseize Control

Request For Service with Data

PPL Event Request

PPL Event Indication

Byte	Description
0, 1	Tag 0x2929
2, 3	Length Variable (Maximum is 100)
4-n	Value[0-3] Null Terminated ASCII string

0x292A - SIP Referred By Header Parameters TLV

This TLV does the following:

- Reports the Referred-By header parameters, if present, in the received REFER or INVITE request.
- Writes the parameters of the Referred-By header in the outbound REFER or INVITE request.

Used in:

Route Control
Outsize Control
Request For Service with Data
PPL Event Request
PPL Event Indication

Byte	Description	
0, 1	Tag	0x292A
2, 3	Length	Variable (Maximum is 100)
4-n	Value	Null Terminated ASCII string

0x292D NPDI SIP Contact URI User Name

This TLV contains the user name parsed from the contact header in ASCII format.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Byte	Description	
0, 1	Tag	0x292D
2, 3	Length	Variable
4-n	Value	NULL Terminated ASCII string for SIP Contact user name

0x292E NPDI SIP Contact Password

This TLV contains the password in the contact header in ASCII format.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x292E
2, 3	Length Variable
	Value NULL Terminated ASCII value for SIP Contact password

0x292F NPDI SIP Contact Hostname

This TLV provides the IP address from the Contact URL in ASCII string.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x292F
2, 3	Length Variable
	Value NULL Terminated ASCII value for SIP 'Contact' hostname

0x2930 NPDI SIP Contact Port

This TLV provides the port from Contact URL.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2930
2, 3	Length 0x0004
4-7	Value Variable If this TLV is not present, a default value of 5060 is used.

0x2931 NPDI SIP Contact Expires

This TLV defines the seconds remaining before the Contact expires.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2931
2, 3	Length 0x0004
4-7	Value [0-3] Variable

0x2933 SIP Contact Transport Type

Specifies the transport type contained in the registration method.

Used in:

0x0033 NPDI Universal ICB in:

Setup Indication message

PPL Event Indication message

Byte	Description
0, 1	Tag 0x2933
2, 3	Length 0x0001
4-7	Value[0] 1 - UDP 2 - TCP

0x2934 SIP Contact URI User Information Qualifier

Use this TLV to append a user-defined ASCII string to the Contact URI user name in outbound SIP calls from the CSP. Specifically, the ASCII string is populated in the user information of the Contact-URI header in the outbound SIP INVITE message.

When the CSP is in a SIP/PSTN gateway environment, you can use this TLV to report the originating trunk group information in a PSTN-to-SIP call.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x2934
2, 3	Length Variable
4-n	Value[0-n] Null-terminated ASCII string

0x2935 SIP Contact URI Parameters

Use this TLV to receive and send Contact-URI parameters to and from host applications.

For inbound calls, this TLV carries all of the Contact URI parameters received by the SIP software in the *Request for Service with Data* message to host applications.

For outbound SIP calls, this TLV allows you to insert Contact URI parameters in SIP INVITE messages.

To report this TLV you must first set Bit 5 in the TLV *0x027F SIP Message Information Mask (4-86)*.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x2935
2, 3	Length Variable
4-n	Value[0-n] Null-terminated ASCII string for URI parameters in the CONTACT-URI.

0x2936 SIP Tunnel Type

For all outgoing messages, this TLV enables and disables the use of tunneled data and specifies the tunneled data type.Used in:

0x0033 NPDI Universal ICB in:

Route Control message
Outseize Control message
PPL Event Request message

Byte	Description
0, 1	Tag 0x2936
2, 3	Length 0x0002
4-6	Value[0-2] 0x0001 No tunneling (Default) 0x0002 CSP UPDF Tunneling 0x0004 Custom MIME Body

0x2937 NPDI SIP Authenticate Scheme

Use this TLV to specify the authentication scheme: basic or digest (a scheme based on cryptographic hashes).

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message with Event IDs 0x0C

Byte	Description
0, 1	Tag 0x2937
2, 3	Length 0x0001
4, 5	Value[0-1] 0x00 Basic 0x01 Digest

0x2938 NPDI SIP Authentication Realm

The TLV specifies the realm used in the www-authenticate header.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message with Event IDs 0x0C

Byte	Description
0, 1	Tag 0x2938
2, 3	Length Variable
4-n	Value[0-n] Null-terminated ASCII string for realm

0x2939 NPDI SIP Authenticate Username

Use this TLV to specify the username used to authenticate the request.

Used in:

0x0033 NPDI Universal ICB in:

PPL Event Request message with Event IDs 0x0C

Byte	Description
0, 1	Tag 0x2939
2, 3	Length Variable
4-n	Value[0-n] NULL terminated ASCII string for username

0x293A NPDI SIP Authenticate Password

Use this TLV to specify the password used to authenticate the request.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

PPL Event Request message with Event IDs 0x0C

Byte	Description
0, 1	Tag 0x293A
2, 3	Length Variable
4-n	Value[0-n] NULL Terminated ASCII string for password

0x293B NPDI SIP Authorization Username

Use this TLV to specify the username used to generate the Authorization header for an outgoing request when the CSP receives a 401 response.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Byte	Description
0, 1	Tag 0x293B
2, 3	Length Variable
4-n	Value[0-n] NULL Terminated ASCII string for username

0x293C NPDI SIP Authorization Password

Use this TLV to specify the password used to generate the Authorization header for an outgoing request when the CSP receives a 401 response.

Used in:
 0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag 0x293C
2, 3	Length Variable
4-n	Value[0-n] NULL Terminated ASCII string for password

0x293D NPDI SIP Proxy Authorization Username

Use this TLV to specify the username used to generate Proxy-Authorization header for an outgoing request when the CSP receives a 407 response.

Used in:
 0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag 0x293D
2, 3	Length Variable
4-n	Value[0-n] NULL Terminated ASCII string for username

0x293E NPDI SIP Proxy Authorization Password

Use this TLV to specify the password used to generate the Proxy-Authorization header for an outgoing request when the CSP receives a 407 response.

Used in:
 0x0033 NPDI Universal ICB in:
Route Control message

Byte	Description
0, 1	Tag 0x293E
2, 3	Length Variable
4-n	Value[0-n] NULL Terminated ASCII value for password

0x293F NPDI SIP Authentication Timeout

Use this TLV to specify the timeout for authentication response.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

PPL Event Request message with Event IDs 0x0C

Byte	Description
0, 1	Tag 0x293F
2, 3	Length 0x01
4-n	Value[0-n] Timeout in seconds Minimum: 30 seconds Maximum: 255 seconds

0x2941 SIP Authorization Header

Use this TLV to specify the authorization header value in a SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2941
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value for Authorization header.

0x2942 SIP Proxy Authorization Header

Use this TLV to specify the SIP Proxy authorization header value in a SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Route Control message

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2942
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value for Proxy-Authorization header.

0x2943 SIP Authenticate Header

Use this TLV to specify the WWW-Authenticate header value in a SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Release Channel with Data message

Byte	Description
0, 1	Tag 0x2943
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value for WWW-Authzication header.

0x2944 SIP Proxy-Authenticate Header

Use this TLV to specify the Proxy-Authenticate header value in a SIP message.

Used in:

0x0033 NPDI Universal ICB in:

Release Channel with Data message

Byte	Description
0, 1	Tag 0x2944
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value for Proxy-Authzication header.

0x2946 - SIP Request URI Password

Used in:

PPL Event Request message

PPL Event Indication message

Byte	Description
0, 1	Tag 0x2946
2, 3	Length Variable (maximum 20 bytes)
4-n	Value[0-n] Null-terminated ASCII string

0x2947 - SIP Request URI Header

Used in:

PPL Event Request message

PPL Event Indication message

Byte	Description
0, 1	Tag 0x2947
2, 3	Length Variable (maximum of 650 bytes)
4-n	Value[0-n] Null-terminated ASCII string

0x2949 - SIP Response Reason Phrase

This TLV is used when reporting or generating the 182 Reason Phrase.

Not all characters are allowed in the Reason Phrase of a SIP response. Refer to the SIP RFC ABNF for a complete list.

Byte	Description
0, 1	Tag 0x2949
2, 3	Length Variable (Maximum of 250)
4-n	Value Null terminated ASCII string

0x294A - NPDI SIP Extensions

Used in:

Request for Service

PPL Event Indication message

Byte	Description
0, 1	Tag 0x294A
2,3	Length 0x0004
4-7	<p>Value This field is a 32-bit mask. Each bit selects specific SIP Extension SIP message fields and is listed from LSB to MSB.</p> <p>0 - Disable 1 - Enable</p> <p>Supported header tags Bit 0 - Timer Bit 1 - 100rel (PRACK) Bits 2-15 - Reserved</p> <p>Required header tags Bit 16 - Timer Bit 17 - 100rel(PRACK) Bits 18-31 - Reserved</p>

0x294B Notify Status

Used in:

0x0033 NPDI Universal ICB in:

Byte	Description
0, 1	Tag 0x294B
2,3	Length 0x0002
4, 5	Value (0,1) Any appropriate SIP Response value. (Typically 200 OK or 600 Decline)

0x294C Refer Spans Channel

Used in:

0x0033 NPDI Universal ICB in:

Byte	Description
0, 1	Tag 0x294C
2,3	Length 0x0003
4,5	Value(0,1) Span Number
6	Value(2) Channel Number

0x294E SIP Remote IP Address

This TLV reports the IP Address of the remote socket.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message

Byte	Description
0, 1	Tag 0x294E
2, 3	Length 0x0004
4-n	Value[0-n] MSB of the IP Address LSB of the IP Address

0x294F SIP Remote IP Port

This TLV reports the IP Port of the remote socket.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service message

Byte	Description
0, 1	Tag 0x294F
2, 3	Length 0x0002
4-n	Value[0-n] MSB of the IP Port LSB of the IP Port

0x2950 SIP Call ID

Use this TLV to specify the Call ID of the SIP message.

Used in:

Route Control message (ACK only)

Outseize Control message (ACK only)

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2950
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value of Call-ID header.

0x2951 SIP From Tag

Use this TLV to specify the Tag value in the From Header of the SIP message.

Used in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2951
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value of Call-ID header.

0x2952 SIP to Tag

Use this TLV to specify the Tag value in the To Header of the SIP message.

Used in:

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2952
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII value of Tag in To header

0x2953 Subsequent Information Status

If all the NPDI data cannot be sent from the CSP to the host in one *Request for Service (RFS) with Data* message, the remaining data is sent in the *PPL Event Indication* message (component ID 0x00A7 and event ID 0x23). If the CSP sends the data in multiple messages, the *RFS with Data* and subsequent PPL event indications, the CSP adds this TLV to those messages. This TLV indicates the sequence number of the message and whether there is more data to follow in the PPL Event Indication.

Similarly, if all the NPDI data cannot be sent from the host in the *Route Control* or *Outseize Control* message, the remaining data is sent in one or more *PPL Event Request* messages. Each of these messages has to include the proper sequence number.

Used in:

Outseize Control message

Route Control message

PPL Event Request message

Request for Service with Data message

PPL Event Indications message

Byte	Description
0, 1	Tag 0x2953
2, 3	Length 0x0002
4	Value[0] Sequence number of the message The <i>Request for Service</i> message has a value of 1. Subsequent PPL Event Indications have a value of 1+n where n is the number of the PPL Event Indication. The <i>Route Control</i> or <i>Outseize Control</i> message have a value of 1. Subsequent PPL Event Requests have a value of 1+n where n is the number of the <i>PPL Event Request</i> message.
5	Value[1] Last message indicator 0 there are more messages to follow 1 the current message is the last one

0x2954 SIP Request URI User Name

Used to specify the user name in the Request URI. If the host provides the Request URI parameters, it must also provide the “To Header” parameters (see TLVs 0x2919, 0x291A, 0x291B, 0x291C). The host must also provide the URI host name and port name (See TLVs 0x2955 and 0x2956).

Used in:

0x0033 NPD Universal ICB in:

Route Control message

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2954
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII for user name in Request URI.

0x2955 SIP Request URI Host Name

Used to specify the host name in the Request URI. If the host provides the Request URI parameters, it must also provide the “To Header” parameters. (See TLVs 0x2919, 0x291A, 0x291B, 0x291C). The host must also provide the URI user name and port name (See TLVs 0x2954 and 0x2956).

Used in:

0x0033 NPD Universal ICB in:

Route Control message

Request for Service with Data message

Byte	Description
0, 1	Tag 0x2955
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII for host name in Request URI.

0x2956 SIP Request URI Port

Used to specify the port name in the Request URI. If the host provides the Request URI parameters, it must also provide the “To Header” parameters. (See TLVs 0x2919, 0x291A, 0x291B, and 0x291C). The host must also provide the URI host name and user name (See TLVs 0x2954 and 0x2956).

Used in:

*0x0033 NPD Universal ICB in:
Route Control message*

Byte	Description
0, 1	Tag 0x2956
2, 3	Length 0x0004
4	Data[0] MSB Port in Request URI Data[1] : Data[2] : Data[3] LSB Port in Request URI

0x2957 SIP Request URI User Information Qualifier

Use this TLV to append a user-defined ASCII string to the Request URI user name in outbound SIP calls from the CSP. Specifically, the ASCII string is populated in the user information of the Request-URI header in the outbound SIP INVITE message.

When the CSP is in a SIP/PSTN gateway environment, you can use this TLV to report the terminating trunk group information in a PSTN-to-SIP call.

If the host provides the Request URI parameters, it must also provide the “To Header” parameters. (See TLVs 0x2919, 0x291A, 0x291B, and 0x291C).

Used in:

*0x0033 NPD Universal ICB in:
Route Control message
Outseize Control message*

Byte	Description
0, 1	Tag 0x2957
2, 3	Length Variable
4-7	Value[0-n] Null-terminated ASCII string

0x2958 SIP Request URI Parameters

Use this TLV to receive and send proprietary Request URI Parameters to and from host application. For inbound calls, this TLV carries all of the Request URI parameters received by the SIP stack in the *Request for Service with Data* message to host applications.

To report this TLV to the host, you must program the new Bit 6 in the SIP Message Information Mask TLV (0x027F) used in the *VoIP Protocol Configure* message (0x00EE).

For outbound calls, host application developers can use this TLV in the *Route Control* and *Outseize Control* messages to insert Request URI parameters in SIP INVITE messages.

Used in:

0x0033 NPDI Universal ICB in:

Request for Service with Data message

Route Control message

Outseize Control message

Byte	Description
0, 1	Tag 0x2958
2, 3	Length Variable
4-n	Value[0-n] Null-terminated ASCII string

0x2959 SIP Remote Party ID

Used in:

Request for Service with Data (0x002D)

PPL Event Indication (0x0043)

PPL Event Request (0x0044)

Route Control (0x00E8)

Outseize Control (0x002C)

Byte	Description
0, 1	Tag 0x2959
2, 3	Length Variable (Maximum of 250 bytes when used in Outseize or Route Control or subsequent PPL Event Request messages)
4-n	Value Contains the value of the Remote Party ID header as a null-terminated ASCII string.

0x295A SIP RPID Privacy

Used in:

Request for Service with Data (0x002D)

PPL Event Indication (0x0043)

PPL Event Request (0x0044)

Route Control (0x00E8)

Outseize Control (0x002C)

Byte	Description	
0, 1	Tag	0x295A
2, 3	Length	Variable (Maximum of 250 bytes when used in Outseize or Route Control or subsequent PPL Event Request messages)
4-n	Value	Contains the value of the RPID Privacy header as a null terminated ASCII string.

0x295B SIP Subject Header

The subject header is also supported in the INFO message. The CSP allows the host for read and write access to the Subject header. The Subject Header TLV (0x295B) reports the Subject header within the PPL Event Indication for an inbound INFO message. This reporting of the Subject header in the INFO message is not configurable.

The Subject Header TLV (0x295B) is used in the PPL Event Request for outbound INFO to include the subject header. This TLV is also used in the PPL Event Request message for an outbound INFO message to include the subject header.

PPL Event Request message

PPL Event Indication message

Byte	Description	
0, 1	Tag	0x002B
2, 3	Length	Variable (Maximum of 250)
4-n	Value	Null terminated ASCII string

0x295C SIP Message Body

This TLV adds a message body to a SIP message. It also reports the message body (other than Content Type) if present, in a SIP message. Prior to this feature, this TLV added/reported the message body only for the SIP INFO message. The SIP stack adds a new line after the end

of the message body. The host does not need to include this line in the TLV. The new line at the end of the message body will not be reported in this TLV.

PPL Event Request message

PPL Event Indication message

Byte	Description	
0, 1	Tag	0x002C
2, 3	Length	Variable (Maximum of 500)
4-n	Value	Null terminated ASCII string

0x295D Content Type

This TLV adds the content type to a SIP message. It also reports the content type, if present, in a SIP message. Prior to this feature, this TLV adds/reports content type only for the SIP INFO message. If there is a valid message body but the host has not supplied the content type, then the SIP stack adds the following content type as the default: “Content-Type: application/custom”

PPL Event Request message

PPL Event Indication message

Byte	Description	
0, 1	Tag	0x002D
2, 3	Length	Variable (Maximum of 100)
4-n	Value	Null terminated ASCII string

0x295E SIP Hostname

This TLV contains the Hostname in the Header Field.

Byte	Description
0, 1	Tag 0x295E
2, 3	Length Variable
4-n	Value A null-terminated ASCII string

0x295F SIP Port Number

This TLV contains the Port Number in the Header Field.

Byte	Description
0, 1	Tag 0x295F
2, 3	Length 0x0004
4-7	Value Variable

0x2960 Privacy Header

This TLV reports the “Privacy” header if present in the inbound INVITE message. The following are the defined set of Privacy header contents but they are not limited to these.

“header” / “session” / “user” / “none” / “critical” / “id”

Byte	Description
0, 1	Tag 0x2960
2, 3	Length Variable (Maximum of 250)
4-n	Value Null terminated ASCII string

0x2961 Private Header Container

This TLV contains nested TLVs that in turn contain the P-Header type and P-Header content. This TLV uses the following nested TLVs:

- 0x2962 Private Header Type TLV
- 0x2963 Private Header Data TLV

This TLV along with the two nested TLVs is reported in the RFS as many number of times as the number of P-Headers appear in the INVITE message. The total length of the NPDI data that can be reported to the host limits this number.

Byte	Description
0, 1	Tag 0x2961
2, 3	Length Variable (Maximum of 250)

0x2962 Private Header Type

This TLV contains the P-header type. Use it within the Private Header Container TLV (0x2961) as a nested TLV and in combination with the Private Header data TLV (0x2963). It does not have any meaning if used as a standalone TLV.

Byte	Description
0, 1	Tag 0x2962
2, 3	Length 0x0001
4-n	Value 0x01 - P-Asserted-Identity 0x02 - P-Preferred-Identity 0x03 - P-Access-Network-Info

0x2963 Private Header Data

This TLV contains the content of the P-header. Use it within the Private Header info TLV (0x2961) as a nested TL and in combination with the Private Header Type TLV (0x2962). It does not have any meaning if used as a standalone TLV.

Byte	Description
0, 1	Tag 0x2963
2, 3	Length Variable (Maximum of 241)
4-n	Value Null terminated ASCII string

0x2964 SIP MIME Information

Used in:

0x0033 NPDI Universal ICB in:

Route Control message*Outsize Control* message*Release Channel with Data**Connect with Data**Channel Released with Data**Request for Service with Data* message*PPL Event Request* message*PPL Event Indication* message

Byte	Description
0, 1	Tag 0x2964
2, 3	Length Variable (Maximum of 780 bytes)

0x2965 SIP Content Encoding

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2965
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII String

0x2966 SIP Content Disposition

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2966
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII String

0x2967 SIP Content Language

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2967
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII String

0x2968 SIP MIME Message Body

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x2968
2, 3	Length Variable
4-n	Value[0-n] Null Terminated ASCII String

0x2969 SIP Session Expiry Interval

This TLV reports the session expiry interval used in the Re-transmit INVITE message.

Byte	Description
0, 1	Tag 0x2969
2, 3	Length 0x0004
4-8	Value Timer Value

0x2970 SIP Minimum Session Expiry Interval

This TLV reports the minimum session expiry interval used in the Re-transmit INVITE message .

Byte	Description
0, 1	Tag 0x2970
2, 3	Length 0x0004
4-8	Value Timer Value

0x299A SIP Header Field Container

For SIP calls, this TLV contains the nested TLVs that in turn contain information regarding SIP Header Fields.

Used in:

0x0033 NPDI Universal ICB

This TLV uses the following nested TLVs:

- 0x299B SIP Header Field ID
- 0x299C SIP Header Field

Byte	Description
0, 1	Tag 0x299A
2, 3	Length Variable

0x299B SIP Header Field ID

This TLV contains the ID of the Header Field being reported.

Used in:

0x0033 NPDI Universal ICB

Byte	Description
0, 1	Tag 0x299B
2,3	Length 0x0002
4,5	Value[0] Valid value: 0x0022 - Via

0x299C SIP Header Field

For SIP calls, this TLV contains the nested TLVs that in turn contain the SIP Header Field Parameters.

Used in:

0x0033 NPDI Universal ICB

This TLV uses the following nested TLVs:

- 0x295E SIP Hostname
- 0x295F SIP Port Number

Byte	Description
0, 1	Tag 0x299C
2, 3	Length Variable

0x29D4 SIP Do Not Close Socket

Allows an out bound call via TCP to keep its socket. Normally TCP sockets are closed after a period of time after the last message in a transaction is sent. If you include this TLV in a *Route Control* message that causes the use of a TCP socket, the socket will not be closed until explicitly commanded to close by the host with a PPL Event Request.

Used in:

*0x0033 NPDI Universal ICB in:
Route Control* message

Byte	Description
0, 1	Tag 0x29D4
2, 3	Length 0x0001
4	Value[0] 0x00 Close socket as if this TLV were not sent 0x01 Do not close this socket (persistent mode)

0x29FF Media Local End Point Information

SIP

For SIP calls, this TLV contains the nested TLVs that in turn contain the entire Session Description Protocol (SDP) in NPDI format. In the *Request for Service* or *PPL Event Indication* messages, this TLV cannot exceed 250 bytes.

Used in: 0x0033 NPDI Universal ICB

RTP

This TLV uses the following nested TLVs that contain the Local End-Point Media Information.

- 0x2A07 Media Port
- 0x2A0E Media Connection Address

Byte	Description
0, 1	Tag 0x29FF
2, 3	Length Variable

0x2A00 Media Remote End Point Information

SIP

For SIP calls, this TLV contains the nested TLVs that in turn contain the entire Session Description Protocol (SDP) in NPDI format.

Used in: 0x0033 NPDI Universal ICB

RTP

This TLV uses the following nested TLVs that contain the Remote End-Point Media Information.

- 0x2A07 Media Port
- 0x2A0E Media Connection Address

Byte	Description
0, 1	Tag 0x2A00
2, 3	Length Variable

0x2A01 Media Per Stream Information

SIP

For SIP calls, this TLV contains the nested TLVs that in turn contain the media stream in NPDI format.

Used in: 0x0033 NPDI Universal ICB

RTP

For Media Streaming over RTP, this TLV is a nested TLV that contains the media stream information. This TLV is nested in the following TLVs in the *Play File Start 0x011B* message:

0x29FF Media Local End Point Information

0x2A00 Media Remote End Point Information

Byte	Description
0, 1	Tag 0x2A01
2, 3	Length Variable

0x2A02 Media Per Codec Information

SIP

This TLV contains the nested TLVs that in turn contain information about each codec per media stream.

Used in: 0x0033 NPDI Universal ICB

RTP

Byte	Description
0, 1	Tag 0x2A02
2, 3	Length Variable

0x2A03 Media Type

SIP

This TLV defines the type of media for each media stream.

Used in: 0x0033 NPDI Universal ICB

RTP

Byte	Description
0, 1	Tag 0x2A03
2, 3	Length 0x0001
4	Value Media Type 0xFF Invalid 0x00 Audio 0x01 Video (Requires Call Agent.)

0x2A07 Media Port

This TLV defines the port for each media stream.

SIP

Used in: 0x0033 NPDI Universal ICB

RTP

Byte	Description
0, 1	Tag 0x2A07
2, 3	Length 0x0004
4-7	Value [0-3] Media Port

0x2A08 Media Payload Type

This TLV carries the actual payload type ID from either the NPDI static payload types or from network signaling data for dynamic payload types.

0x9049 Route Set Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x9049
2, 3	Length 0x0004
4,5	Value[0,1] Number of Logical Connections
6,7	Value[2,3] Logical Connection ID

0x904A Protocol Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904A
2, 3	Length 0x0024
4,5	Value[0,1] Maximum Application Service Provider
6,7	Value[2,3] Maximum Application Server
8,9	Value[4,5] Maximum Signaling Gateway Process
10,11	Value[6,7] Maximum Signaling Gateway
12-15	Value[8-11] Maximum Route Sets
16-19	Value [12-15] Default Standard
20-23	Value[16-19] Default Network identify
24,25	Value[20,21] Maximum User Parts
26,27	Value[22,23] Maximum Connections
28	Value [24] Number of Maps
29-32	Value [25-28] Network Appearance
33-36	Value[29-32] Standard
37-40	Value[33-36] Network Identity

0x904B Application Server Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904F
2, 3	Length 0x0006
4, 5	Value[0,1] Maximum Number of Application Servers
6, 7	Value[2,3] Actual Number of Application Servers
8, 9	Value[4,5] Application Server ID

0x904C Application Server Process Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904C

2, 3	Length Variable
4,5	Value[0,1] Port
6	Value[2] Number of IP addresses
7-10	Value[3-6] IP Address (4 bytes)
:	Value [:]
:	Value[:] IP Address (4 bytes)

0x904D Signaling Gateway Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904D
2, 3	Length 0x0003
4	Value[0] Mode 0x01 - M3UA AS Mode Override 0x03 - M3UA AS Mode Broadcast
5	Value[1] Number of Signaling Gateway Processes
6	Value[2] Signaling Gateway Process ID

0x904E Signaling Gateway Process Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904E
2, 3	Length Variable
4,5	Value[0] Port
6	Value[2] Number of IP addresses
7-10	Value[3-6] IP Address (4 bytes)
:	Value [:]
:	Value[:] IP Address (4 bytes)

0x904F Connection Query

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x904F
2, 3	Length 0x0004
4,5	Value[0,1] Application Server Process ID
6,7	Value[2,3] Signaling Gateway Process ID

0x9050 General Query Data

Used in:

NGA Configure Query message

Byte	Description
0, 1	Tag 0x9050
2, 3	Length 0x0006
4, 5	Value[0,1] Maximum number of objects
6, 7	Value[2,3] Actual number of objects
8, 9	Value[4,5] Object ID

0x9051 Application Server State Query

Used in:

NGA Configure Query message*NGA State Notify* message*NGA Service Query* message

Byte	Description
0, 1	Tag 0x9051
2, 3	Length 0x0006
4	Value[0] Application Service State 0x00 - Out of Service 0x01 - In Service
5, 6	Value[1,2] Number of logical connections
7, 8	Value[3,4] Logical Connection ID
9	Value[5] Logical Connection State 0x00 - Out of Service 0x01 - In Service

0x9052 Route Set

Used in:

NGA Configure message

Byte	Description
0,1	Tag 0x9052
2,3	Length 0x0010
4-7	Value[0-3] Destination Point Code
8,9	Value[4,5] Number of Routes
10,11	Value[6,7] Route ID
12,13	Value[8,9] Signaling Gateway ID
14-17	Value[10-13] Network Appearance
18,19	Value [14,15] Priority

0x9053 Modify Destination

Used in:

NGA Configure message

Byte	Description
0, 1	Tag 0x9053
2, 3	Length 0x0010
4-7	Value[0-3] Modify Option 0x00000000 - Add Route 0x00000001 - Remove Route
8,9	Value[4,5] Number of Routes
10,11	Value[6,7] Route ID
12,13	Value[8,9] Signaling Gateway ID
14-17	Value[10-13] Network Appearance
16,17	Value [14,15] Priority

0x9054 Modify Protocol

Used in:

NGA Configure message

Byte	Description
0, 1	Tag 0x9054
2,3	Length 0x0011
4-7	Value[0-3] Modify Option 0x00000000 - Add Route 0x00000001 - Remove Route
8	Value[4] Number of Maps
9-12	Value[6] Network Appearance
13-16	Value [7] Standard 0x00000000 - ANSI 0x00000001 - ITU
17-20	Value [8] Network Identity 0x00000000 - International 0x00000001 - National Number Priority 0x00000002 - National Priority 0x00000003 - Invalid Network

0xE001 Command

Used to supports M3UA functionality.

Used in:

NGA Configure message

NGA Service State Configure message

Byte	Description
0, 1	Tag 0xE001
2, 3	Length 0x0002
4, 5	Value[0,1] 0x0000 - Add 0x0001 - Remove 0x0002 - Modify 0x0003 - Up 0x0004 - Down 0x0005 - In Service 0x0006 - Out of Service

0xE002 Service State

Used to supports M3UA functionality.

Used in:

NGA State Notify message

Byte	Description
0, 1	Tag 0xE002
2, 3	Length 0x0002
4, 5	Value[0,1] 0x0005 - Out of Service 0x0006 - In Service

0xE003 AIB Container TLV

Used in the Resource Delete Indication message (0x0129) when deleting a child conference

Byte	Description
0, 1	Tag 0xE003
2, 3	Length 0x0008

4	Value[0]	Address Method 0x00 (Single Entity)
5	Value[1]	Address Element Count 0x01
6	Value[2]	Address Element 0x45
7	Value[3]	Data Length 0x04
8, 9	Value[4, 5]	Parent Conference ID
10, 11	Value[6, 7]	Child Conference ID

BT IUP TLVs

Overview The table below shows the format of the TLVs used in the BT IUP ICB for BT IUP messages.

TLV Name	TLV ID	TLV Length	TLV Data																			
			Byte Number	Bit Description																		
H0, H1 Element	0x01	0x02	0x01	The H0 value																		
			0x02	The H1 value																		
IAM/IFAM Message Indicators	0x02	0x05	0x01	<table border="0"> <tr> <td><u>Bit</u></td> <td><u>Definition</u></td> </tr> <tr> <td>0-5</td> <td>Calling Party Category (CPC) or (CDPC) Only bits 0 through 5 are valid. 			0x04	MSB - Binary Code
Service Indicator Code	0x1D	0x02	0x01	First Octet
			0x02	Second Octet
Six Character Network Address Extension (NAE) - Subaddress	0x1E	0x02-0x07	0x01	NAE Character Count (range 1 to 6)
			0x02	1st NAE Character
			n	nth NAE Character
Service Code	0x1F	0x01	0x01	Service Code

Mapping BT IUP Messages to TLV Format

This section defines the TLVs required in a IUP DATA ICB to compose each message. TLVs may appear in any order within the IUP DATA ICB. If a TLV is not included and is required for the underlying PNO-ISC IUP Message a default value will be supplied from the appropriate configuration byte. Therefore, many messages can be generated from the configuration data area by only encoding a message containing the HOH1 TLV, since this uniquely identifies the message to be sent. However, several messages require additional TLVs to uniquely identify the message (for example, ACI and ASUI).

BT IUP Message	Valid TLVs
Initial Address Message/ Final Address Message (IAM/IFAM)	0x01, 0x02, 0x03, 0x04
Subsequent Address Message/ Final Address Message (SAM/FAM)	0x01, 0x18, 0x19
Additional Setup Information, Type 1 - Full Calling Line Identity	0x01, 0x04, 0x05
Additional Setup Information, Type 2 - Partial Calling Line Identity	0x01, 0x05, 0x06, 0x18
Send N Digits	0x01, 0x07
Send All Digits	0x01, 0x18
Send Additional Setup Information	0x01, 0x08
Address Complete	0x01, 0x09
Congestion	0x01
Terminal Congestion	0x01
Connection Not Admitted	0x01, 0x0A, 0x0B
Repeat Attempt	0x01
Subscriber Engaged	0x01
Subscriber Out of Order	0x01
Answer	0x01, 0x0C
Clear	0x01
Release	0x01, 0x0D
Circuit Free	0x01
Blocking	0x01
Unblocking	0x01
Blocking Acknowledgement	0x01
Unblocking Acknowledgement	0x01
Overload	0x01
Confusion	0x01

BT IUP Message	Valid TLVs
Additional Call Information, Type 1	0x01 , 0x04, 0x0F , 0x10, 0x11
Additional Call Information, Type 2	0x01 , 0x0F , 0x10
Additional Call Information, Type 3	0x01 , 0x04, 0x0F , 0x12, 0x13
Additional Call Information, Type 4	0x01 , 0x0F , 0x12, 0x14
Additional Call Information, Type 5	0x01 , 0x0F , 0x15
Additional Call Information, Type 6	0x01 , 0x0F , 0x16
Additional Call Information, Type 7	0x01 , 0x0F

5 Response Status Values

Overview

Purpose This chapter lists the Response Status Values (RSVs) used in the EXS API for the CSP. These values are in hexadecimal.

Response Status Values List

Hex ID	Name	Description as necessary
00 00-00 0F	These values differ depending on the message that returns them. Please refer to the specific message for the response status values.	
00 10	Positive Acknowledgment (ACK)	The message was successfully processed, and any required actions were successfully completed.
00 11	Bad Checksum	The message checksum does not match the checksum calculated by the system. An error must exist or a field must be missing.
00 12	Invalid Logical Span ID	A field reserved for a logical span ID contains a number larger than the capacity of the switching matrix.
00 13	Invalid Channel Number	A field reserved for a channel number is outside the range of 0–30 for E1 or 0–23 for T1. For E1, you can reference channel 30 only if the channel is configured for CCS, with the <i>E1 Span Configure</i> message.
00 14	Message Invalid for Current Matrix State	The CSP Matrix Series 3 Card is not in a state to accept this message.
00 15	Negative Acknowledgment (NACK)	Message could not be successfully processed. The span in which a link is assigned, can have either CICs or not used at all.
00 16	Invalid Address Range	The address range specified in a block configuration message is not valid.
00 17	Invalid Data Type	Returned in response to a message with invalid data parameters.
00 18	Invalid Channel B State	Channel B is in an invalid state for the action required. The <i>More Status</i> field indicates the state. NOTE: This does not pertain to ISDN B channels.
00 19	Trunk Status Dead	One of the parties involved in a Call Processing message is associated with a dead line.
00 1A	Inseize Failure	Inseize could not be successfully completed (for example, distant end signaling error).
00 1B	Outseize Failure, No Acknowledgment	Outseize failed because acknowledgment signaling conditions were never met (for example, a channel of E&M wink start trunk did not receive a wink).
00 1C	Outseize Failure, Glare	Outseize attempted on trunk involved in inseizure processing.
00 1D	Invalid Channel A State or Invalid PPL Event	Channel A is in an invalid state for the action required. The <i>Status</i> field indicates the state of Channel A. A PPL component has received an invalid event for the current PPL state.
00 1E	Memory Allocation Failure	Channel configuration change failed due to lack of available memory.
00 1F	Invalid Group Number	Reserved for future use.
00 20	Invalid Action Value	Invalid decision parameter action value was received.
00 21	Invalid Time	The value entered for the time is not valid.
00 22	First Outseize Instruction Not A Seize	The first instruction in an <i>Outseize Control</i> message must be a Seize if the channel is idle.
00 23	Outseize "Seize" Instruction Not Allowed	This response is returned if one of the following occurs: An <i>Outseize Instruction List Configure</i> message is sent with a Seize instruction (a Seize instruction cannot be preprogrammed). An <i>Outseize Control</i> message with a Seize instruction is sent when one has been sent previously and the call is still active.

00 24	Outseize Failed Due To No Answer	Outseize failed due to no answer from the distant end.
00 25	Invalid Encoding Format	One of the following is invalid: the encoding format of RAN or the encoding format in a <i>Conference Create</i> message.
00 26	Invalid Conference Size	Sent in response to a host-initiated <i>Conference Create</i> message, when the conference size indicated is less than 2 or greater than the maximum number of channels allowed to be conferenced together.
00 27	DSP Not Configured for Requested Function	No DSPs are configured for the function requested by the host (for example, configuration for service).
00 28	DSP Resources Not Available	No DSP resources are currently available for the requested DSP function. Applies to DSP functions which are not managed as shared resources, for example, <i>Conference Create</i> .
00 29	Invalid Conference Output Option	Conference output option indicated in the <i>Conference Create</i> message is not valid.
00 2A	Invalid Conference ID	Conference ID sent by the host is not associated with any conferences previously established through the <i>Conference Create</i> message. or The conference associated with this conference ID may have been marked for deletion.
00 2B	<i>Conference Create</i> Failure	Conference creation failed while the conference was establishing (for example, the MFDSP card was removed).
00 2C	Conference Establishing	Returned in a <i>Delete Conference</i> , <i>Connect to Conference</i> , or <i>Connect 1-Way to Conference</i> message if the conference associated with the conference ID is in the process of being created.
00 2D	Incompatible PCM Encoding for Conference	Returned in a <i>Connect to Conference</i> and <i>Connect 1-Way to Conference</i> message when the channel encoding format doesn't match that of the conference (for example, A-law encoded channel connected to a μ -law encoded conference).
00 2E	Conference Size Exceeded	Returned in a <i>Connect to Conference</i> message when the conference size has been exceeded.
00 2F	Maximum Broadcast Number Exceeded	Returned in a <i>Connect 1-Way</i> or <i>Connect 1-Way to Conference</i> message when the number of 1-Way broadcasts exceeds the maximum allowed.
00 30	DSP Resource Already Allocated	Returned in a <i>Collect Digit String</i> or <i>DSP Service Request</i> message if digit collection is already active on the specified channel.
00 31	Channel Violation	Returned if an CSP 1000 Matrix Card card is being used in a system with more than 1,024 channels.
00 32	Channels A and B Already Connected	A connect request has been sent for two channels which are already connected.
00 33	SS7 Configuration Error	Possible scenarios regarding virtual spans: 1. Configuring virtual CICs on remote nodes using an SS7 PQ card in the server node. 2. Configuring virtual CICs on a virtual VOCC card (type 0x80) using either an SS7 PQ card or an HP card. 3. Configuring virtual CICs beyond five virtual T-ONE cards or four virtual E-ONE cards on the server node using an SS7 PQ card.
00 34	Ring Timeslot Inaccessible	Remote timeslot is not accessible from this node. Check CSP hardware.
00 35	Invalid Logical Ring ID	
00 36	Unassigned Ring	
00 37	Ring Already Assigned	
00 38	Invalid Ring State	

00 39	No Bandwidth Available	
00 3D	Invalid ICB Data	An information control block has invalid length or count field, or the data within the ICB is invalid. Invalid TLV Count Invalid TLV Length
00 3E	ISDN Congestion	
00 40	SRecord Invalid	
00 41	Download aborted due to invalid SRecord.	
00 42	Restart download due to sequence problem.	
00 44	BRecord Invalid	BRecord not accepted due to invalid value.
00 43	Node Not Ready	A valid Logical Node ID has not been assigned (therefore, <i>Polls</i> cannot be requested) or the CSP is not in a valid state for the requested action (such as <i>Download Begin</i> during Boot State).
00 44	No Download Begin Message Received	A <i>Download SRecord</i> or <i>Download BRecord</i> message was sent without a preceding <i>Download Begin SRecord</i> or <i>Download Begin BRecord</i> message.
00 45	Invalid Download	Sent in response to a <i>Download Complete</i> message when the download does not validate due to an incorrect checksum.
00 47	Invalid Ring Loop Timing	
00 4B	RTP Port in Use	
00 54	SS7 Invalid SCCP TCAP Parameter	An SS7 SCCP TCAP configuration attempt specified an invalid SS7 SCCP TCAP parameter.
00 55	SS7 Invalid SCCP TCAP Configuration Parameter	An SS7 SCCP TCAP configuration attempt specified an invalid SS7 SCCP TCAP configuration parameter. A CSP returns this indication when a host queries for a configuration parameter using the message, SS7 SCCP/TCAP Query (0x78).
00 56	System Busy Condition on Remote Node	
00 57	Conferencing Disabled	
00 58	Invalid Remote Timeslot for Connect 1-way Forced	B address is not a valid remote timeslot. For SIP calls, B address is not bearer switched.
00 59	Outseize Failure, Blocked	
00 5A	DS3 Out of Service	An attempt is being made to bring one of the DS3's spans in service but the DS3 is out of service
00 5B	DS3 Offset Out of Range	DS3 Offset is outside the valid range 0-27
00 5D	Invalid Data Value	Invalid data or data out of range
00 5E	DS3 In Service	An attempt is being made to loop back to a DS3, but the DS3 is in service
00 5F	Invalid Resource Attribute	
00 60	Outseize Failure, Guard Timing	Returned when the connection terminating party is in the guard state allowing for inseizures only.
00 61	Invalid Slot	The slot specified is not valid for the message sent.
00 62	Invalid Span Offset	Field reserved for span offset is outside the valid range for the line card (0-1 for 2-span, 0-3 for 4-span, 0-7 for 8-span).
00 63	Unassigned Span	The host has not yet assigned the specified Logical Span ID to a physical span.
00 64	Unassigned Span A	The host has not yet assigned that span number to a hardware location. If two span/channels exist in message, the first span address is unassigned.
00 65	Unassigned Span B	The host has not yet assigned that span number to a hardware location. If two span/channels exist in message, the second span address is unassigned.

00 66	Outseize Failure, Busied Out	Returned when connection terminating party is busied out.
00 67	Channel B Out of Service	Returned when connection terminating party is out of service due to a span alarm condition, is disabled, or both. Also returned if terminating party is going through error recovery or if no release of the distant end is detected.
00 68	Channel B Not Idle	Returned when the connection terminating party is currently involved in call setup or teardown with another call.
00 69	Span Already Assigned	Span selected to be assigned is already assigned.
00 6A	Span Offset Not Available	A span has been previously assigned to that slot and offset.
00 6B	Span Providing Loop Timing	Span selected to be unassigned has been selected as a loop timing source.
00 6C	Framing Error	An incorrect framing type was specified.
00 6D	Zero Suppression Error	An incorrect zero suppression type was specified.
00 6E	invalid Cable Length	An invalid cable length was specified.
00 6F	Card Out of Service	The card in the slot specified is not in service.
00 70	Single Matrix Out of Service Attempt	A single matrix cannot be taken out of service.
00 71	Channel Out of Service	One or more of the specified channels is out of service.
00 72	Span In Service	The span specified is in service.
00 73	Span Out of Service	The span specified is out of service.
00 74	Invalid Card Type	Incorrect card type for attempted operation.
00 75	Invalid Entity	The entity is out of range.
00 76	DSP SIMM in Service	The SIMM specified is in service.
00 77	Invalid DSP SIMM Value	The value specified for SIMM is invalid.
00 78	Invalid DSP Function Type	The type specified for SIMM is invalid.
00 79	Invalid DSP SIMM Configuration	The configuration specified for SIMM is invalid.
00 7A	Deletion of VRAS SIMM In Progress	An attempt has been made to download a recorded announcement to a SIMM while the SIMM is in the process of being deleted.
00 7B	Another Announcement Download is in Progress	An unsuccessful attempt has been made to download a recorded announcement while another recorded announcement download is in progress.
00 7C	No Recorded Announcement Download Initiate Message Received	A <i>Recorded Announcement Download</i> message has been sent without a prior <i>Recorded Announcement Download Initiate</i> message sent.
00 7D	CCS Redundant I/O Card Not Available	ISDN or SS7 card in a redundant system is missing or unavailable.
00 7E	RAN Download to Out of Service DSP	An attempt was made to download a recorded announcement to a DSP that is out of service.
00 7F	Software module still locked.	This value is returned when attempting to configure a locked module for which no product license has been downloaded.
00 80	Partial Dial Condition	The receive inter-digit timer has expired.
00 81	Permanent Signal Condition	The 1st receive digit timer has expired.
00 82	Failure to Receive Wink 1	The maximum Receive Wink 1 detection timer has expired.
00 83	Failure to Receive Wink 2	The maximum Receive Wink 2 detection timer has expired.
00 84	Failure to Receive Wink 3	The maximum Receive Wink 3 detection timer has expired.
00 85	Failure to Receive Wink 4	The maximum Receive Wink 4 detection timer has expired.
00 86	Failure to Receive Wink 5	The maximum Receive Wink 5 detection timer has expired.
00 87	Failure to Receive Wink 6	The maximum Receive Wink 6 detection timer has expired.
00 88	Failure to Receive Wink 7	The maximum Receive Wink 7 detection timer has expired.
00 89	Failure to Receive Wink 8	The maximum Receive Wink 8 detection timer has expired.

00 8A	No SIMM In Service For Requested Function	There is no SIMM currently in service and configured for tone generation or VRAS.
00 8B	No Outpulsing Data Available	Outpulse data is not available for the stage indicated. This response is also returned when connecting to an idle SS7 channel.
00 8C	No Action ICBs in Message	An <i>Outseize Control</i> or <i>Inseize Control</i> message was sent without any action ICBs included.
00 8D	No Data ICBs in Message	An <i>Outseize Control</i> message was sent without a required data ICB included.
00 8E	Wink Tolerance Exceeded	Given incoming wink exceeded maximum allowed duration.
00 8F	Failure to Detect Off-hook	An ANI request off-hook was not detected within the detection interval.
00 90	Failure to Detect Dialtone	Dialtone not detected within detection interval.
00 91	Inpulsed Stage Not Collected	Collection of given stage of incoming digits not indicated.
00 92	Inpulsing Complete Timeout	Time for complete incoming digit string collection for a given stage exceeded maximum time allowed.
00 93	Invalid Inpulsed Source Span/Channel	An invalid span/channel is indicated as the inpulsing channel.
00 94	No Valid Inpulsed Data to Outpulse	An Outpulse Stage N with Previously Inpulsed Digits instruction was initiated, however, the specified inpulsing has not occurred or has failed.
00 96	Invalid Configuration Request for Span	Specified configuration request for span is invalid.
00 98	No ULC Module	ULC module is missing.
00 99	Invalid Configuration Request	Configuration request is invalid.
00 9A	Invalid Command for Card Type, Span, or Channel	Message does not apply to this card, span, or channel.
00 9B	Illegal D Channel Function	For ISDN D channel call control administration only.
00 9C	Invalid ISDN D Channel	ISDN PRI D channel is not valid.
00 9D	Invalid ISDN B Channel	ISDN PRI B channel is not valid.
00 9E	Invalid ISDN Facility	ISDN facility is invalid.
00 9F	Invalid Value for Entity	The value specified for entity is invalid.
00 A0	SIMM Not Present	SIMM specified is not present.
00 A1	D Channel Assigned	A D channel is assigned on span ID selected.
00 A2	Called Party Mandatory for ISDN Setup	The called party digits are mandatory instruction elements over ISDN PRI.
00 A3	Card Not Ready for Configuration	The card is not in a valid state to accept configuration data.
00 A4	ISDN D Channel Exceeds Maximum	The ISDN card specified can not be configured for another D channel. Check the card's address mode.
00 A5	Invalid Option for Protocol	Protocol assigned to channel in ranges does not allow for the function the host is trying to perform.
00 A6	PPL Table Size Exceeds Max	Size of table host wishes to download is too large.
00 A7	PPL Table Already Exists	Table ID already in use.
00 A8	PPL Table Does Not Exist	Table ID referenced does not yet exist.
00 A9	PPL Table Does Not Validate	The table the host has downloaded does not validate. Further information can be found in Byte and Entity fields of message responding to this error.
00 AA	Insufficient Hardware	The function the host is trying to perform can not be performed because the hardware needed is not present.
00 AB	PPL Table Part of Protocol	Error occurred trying to delete a Primitive Table or State/Event Table. The protocol that the table is associated with must be deleted first.
00 AC	Invalid Command for ISDN Facility	The command for the ISDN facility was not valid.

00 AD	DSP Resource Inconsistency	Returned in a <i>Collect Digit String</i> or <i>DSP Service Request</i> message if digit collection is already active on the specified channel. Also returned when the host attempts to configure two transmitters on one card at the same time.
00 AE	Hardware Not Configured for DSP Function	The DSP resource management software has been requested to provide a DSP resource which does not exist. Please check DSP configurations of DSP card by sending a <i>Card Status Query</i> message.
00 AF	PPL Layer Forward Signal Timeout	Forward R2 Signal has not been detected within the maximum amount of time allowed.
00 B0	PPL Layer Backward Signal Timeout	Backward R2 Signal has not been detected within the maximum amount of time allowed.
00 B1	PPL Layer Premature Answer	Answer was detected on an outgoing call before call setup completion.
00 B2	PPL Layer Congestion Received	Backward R2 Congestion Signal has been detected.
00 B3	System Table in Use	System software is using the table you are trying to modify/create. Please wait a few seconds and try again.
00 B4	Line Card Response To Matrix Timeout	The matrix timed-out waiting for a response from a line card. Check configuration for channel ranges that span more than two cards.
00 B5	CPA Member Exceeds Maximum For Class	The maximum number of call progress analysis patterns which can be included in a class has been reached.
00 B6	CPA Pattern Exceeds Maximum	The maximum amount of call progress analysis patterns supported by the system has been reached.
00 B7	CPA Tone Group Exceeds Maximum	The maximum amount of call progress analysis tone groups supported by the system has been reached.
00 B8	Invalid Pattern ID	An invalid pattern ID has been specified for call progress analysis.
00 B9	Invalid Interval Descriptor Count	An invalid interval descriptor count has been specified for call progress analysis.
00 BA	CPA Classes Exceeds Maximum	The maximum amount of call progress analysis classes supported by the system has been reached.
00 BB	Invalid CPA Class	An invalid call progress analysis class was specified in a configuration message.
00 BC	Invalid Data Found at Byte N	The message became invalid because of data found at byte offset N. See the LSB of the <i>Status</i> field of the message for the byte offset where data became invalid.
00 BD	Invalid Table Type	The table type specified is invalid.
00 BE	Invalid Table ID	The table ID specified is invalid.
00 BF	ISDN Response Wait Timeout	ISDN-initiated message timed-out; waiting for a response from the network (for example, Register with no Release Complete).
00 C0	Action Denied	Action request denied.
00 C1	Action Rejected	Action request rejected.
00 C2	Slot Assigned As Standby	The slot number is assigned as a standby slot.
00 C3	Slot Not Assigned As Standby	The slot number is not assigned as a standby slot.
00 C4	Standby I/O Relay State Mismatch	The states of the relays of the I/O cards specified do not match (relays on one are enabled; relays on the other are disabled).
00 C5	Incompatible Line Card Types	The line cards specified are not compatible.
00 C6	Redundant I/O Cards Not Present	Redundant I/O cards are not present in one or more of the slots specified.
00 C7	Line Card Switchover Already Completed	The <i>Line Card Switchover</i> requested has already been completed.
00 C8	Invalid SIMM Type	Trying to perform VRAS functions on a non-VRAS SIMM.

00 C9	Invalid Recorded Announcement ID	The recorded announcement ID is not in the allowable range or the host has requested a recorded announcement ID that does not exist in the system. <u>Allowed Range</u> MFDSP/DSP-ONE: 0 - 4,095 DSP Series 2: Not Applicable
00 CA	Recorded Announcement Already Exists	The host has attempted to download an announcement using a recorded announcement ID that is already stored in the system.
00 CB	Insufficient Memory on VRAS SIMM	Not enough memory to store the specified recorded announcement.
00 CC	Maximum Recorded Announcement Limit Reached on VRAS SIMM	The host has attempted to download more than the maximum allowed recorded announcements to a particular VRAS SIMM. MFDSP - 300 DSP-ONE - 2,048 DSP Series 2 - Does Not Apply
00 CD	Invalid IE Length	The host has sent an information element (IE) in an ICB with an incorrect length.
00 CE	Invalid IE Count	The host has sent an ICB with an incorrect <i>IE Count</i> value.
00 CF	Invalid Component Type	The host has sent an ICB with an incorrect component type.
00 D0	ISDN D Channel Switchover Timed Out	The D channel switchover could not be completed due to timer expiration.
00 D1	Invalid ISDN Connection Endpoint Identifier	A valid Connection Endpoint Identifier could not be found for the addressed D channel.
00 D2	Invalid AIB	The address information block (AIB) is not in the proper format, or it addresses an invalid PPL state machine or channel.
00 D3	Invalid Protocol ID	A protocol ID specified in a PPL message is invalid.
00 D5	Channel Already In Service	Applies to ISDN and SS7 only. Indicates that you attempted to either assign or de-assign a protocol to a channel that is in service.
00 D6	Invalid Command For Trunk Front End	An invalid command was sent from the host for a trunk front end.
00 D7	End Of PPL Audit Data	The end of the PPL auditing data has been reached. There are no more PPL auditing blocks in the PPL auditing logs.
00 D8	Invalid SS7 Signaling Stack ID (0-3)	A signaling stack was specified that either: Was greater than the allowed values (0-3), or Did not match the signaling stack for the primary resource
00 D9	SS7 Signaling Stack Already Configured	An attempt was made to configure an SS7 signaling stack that is already configured.
00 DA	Invalid SS7 Module Count	An attempt was made to configure an SS7 signaling stack with an invalid number of modules. The module count must be 3.
00 DB	Duplicated SS7 Module	An SS7 signaling stack configuration attempt specified the same SS7 model more than once.
00 DC	Unsupported SS7 Module Variant	An SS7 signaling stack configuration attempt specified an unsupported SS7 module variant.
00 DE	Invalid SS7 Module Type	An SS7 signaling stack configuration attempt specified an invalid SS7 module type.
00 DF	Invalid SS7 Signaling Stack Configuration	An SS7 signaling stack configuration attempt could not be interpreted correctly.
00 E0	SS7 Signaling Stack Not Configured	An SS7 signaling stack configuration attempt specified a signaling stack ID that is not configured.
00 E1	Invalid SS7 Signaling Link ID	An invalid SS7 signaling link ID was specified that was either: Too large for the SS7 card model, or An attempt was made to de-configure a link that is not configured.

00 E2	Invalid SS7 Signaling Link Set ID	An invalid SS7 signaling link set ID was specified. Valid Link Set IDs are 0 to 35.
00 E3	SS7 Signaling Link Set Not Configured	An SS7 configuration attempt specified a signaling link set that is not configured.
00 E4	SS7 Signaling Link Already Configured	An SS7 configuration attempt expected the specified SS7 signaling link either: Was not configured, or Did not have configured SS7 signaling links
00 E5	Invalid SS7 SLC	An SS7 configuration attempt specified an invalid SLC. Valid SLC codes are 0 to 15.
00 E6	SS7 Signaling Link Set Already Configured	An SS7 configuration attempt expected either: The specified SS7 signaling set was not configured, or The specified SS7 signaling stack had no configured SS7 signaling link sets
00 E7	SS7 APC Already Configured	An SS7 configuration attempt specified an adjacent point code (APC) that has already been associated with another link set. All links within a SS7 signaling stack that link to an adjacent signalling point must belong to a single link set.
00 E8	Invalid SS7 Signaling Link Data Rate	An SS7 configuration attempt specified an invalid signaling link data rate. Valid data rates are 64 Kbps (0) and 56 Kbps (1).
00 E9	SS7 SLC Already Configured	An SS7 configuration attempt specified an SLC that has already been assigned to another link within the same link set.
00 EA	Invalid DCE-DTE Configuration	An SS7 configuration attempt specified an invalid DCE-DTE configuration.
00 EB	SS7 Signaling Route Already Configured	One of the following is true: An SS7 signaling route configuration specified a route ID that already exists, or An SS7 signaling route configuration attempted to de-configure a destination for which CICs are still configured. An SS7 signaling linkset configuration attempted to de-configure a linkset for which routes are still configured.
00 EC	Invalid SS7 Signaling Route Mode Configuration	An <i>SS7 Signaling Route Configure</i> message failed due to one of the following: It specified a previously configured destination ID, but the specified stack ID or DPC did not match the previously configured destination ID. It used a destination ID that was not previously configured, but a previously configured destination ID for the signaling stack has a matching DPC. It reused the same link set to the same DPC (Route duplication) An <i>SS7 Signaling Route Query</i> message failed due to one of the following: An invalid destination ID (valid IDs are 0 to 63) An invalid route ID (valid IDs are 0 to 254) Either the specified route ID or destination ID is not configured to the specified stack ID The specified destination ID and route ID are inconsistent
00 ED	No SS7 Signaling Route Entry Available	An <i>SS7 Signaling Route Configure</i> message was received and there were no unused route table entries. The CSP supports up to 20 routes per stack.
00 EE	SS7 Signaling Destination Not Configured	An SS7 configuration attempt specified a destination in the SS7 signaling stack that was not previously configured.

00 EF	No SS7 Signaling DPC Entry Available	An <i>SS7 DPC-CIC Configure</i> message was received specifying a DPC when no more DPC table space is available. The system allows for one DPC per span. If you try to configure more than 128 CIC groups on one system, you will get this message.
00 F0	CCS Redundancy Already Configured	A CCS redundancy configuration attempt specified a primary and/or secondary slot that has previously been configured.
00 F1	CCS Redundancy Not Configured	A CCS redundancy configuration or query message was received before a <i>CCS Redundancy Configure</i> message was received.
00 F2	CCS Redundancy: Not A Primary Slot	The <i>CCS Redundancy Configure</i> message attempted to reference the secondary card in a CCS redundant pair. You must reference the primary card only.
00 F3	Channel Already an SS7 CIC	An <i>SS7 CIC Configure</i> message was received that specified a CIC (or group thereof) that has been previously configured for the same channel.
00 F4	Primary SS7 Slot Same As Secondary Slot	An <i>CCS Redundancy Configure</i> message was received specifying the same slot as the primary and secondary slot.
00 F5	No SS7 Signaling Links Configured	An SS7 configuration attempt specified one of the following: An SS7 signaling link that is not configured An SS7 signaling link set that has no configured SS7 signaling links
00 F6	No SS7 Signaling Routes Configured	An SS7 configuration attempt specified a destination ID or route ID that was not configured.
00 F7	SS7 DPC-CIC Already Configured	An <i>SS7 DPC-CIC Configure</i> message was received that specified a DPC-CIC (or group thereof) that has been previously configured for the same signaling stack.
00 F8	No SS7 Configuration Entity Available	An SS7 signaling route configuration attempt failed because it specified an entity (destination ID or route ID) that was not currently configured, but may have been configured previously. An SS7 DPC-CIC configuration attempt failed because no free DPC-CIC resources were available.
00 F9	Invalid Number of SS7 ISUP Parameters	An <i>SS7 ISUP Message Configure</i> message was sent with an invalid number of parameters.
00 FA	Invalid SS7 ISUP Message Type	An <i>SS7 ISUP Message Configure</i> message was sent with an illegal Message Configuration Entry value.
00 FB	Node Already Exists	The <i>Assign Logical Node ID</i> message failed because node is already assigned.
00 FC	Invalid Node ID	A node ID is invalid because it met one of the following conditions: Specified node ID is greater than maximum value of 31 (0x1F). Specified node ID is greater than maximum value allowed when CSP conferencing is enabled.
00 FD	Node ID Not Configured	Assignment of spans failed because node is not yet assigned. When sending <i>SS7 CIC Configure</i> (0x6A) over CSP, this response value indicates the Ethernet is not available to the SS7 I/O card and you should check the connection.
00 FE	Maximum Number of Redundant Objects Reached	
11 11	Invalid Module	Module specified is invalid (Valid range is 0x00 - 0x03)
11 12	Module Not Present	Module specified is not present
11 13	Module Not Ready	Module is not in a state to receive messages
12 00	SIP Common Error	
12 01	Invalid IP Signaling Series 3 Card ID	Invalid IP Signaling Series 3 Card ID used, or ID is out of the valid range
	User Not Found	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
12 02	Invalid TLV tag	

12 03	MatrixInternal error	
	Invalid PPL event	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
12 04	Configuration Not Completed	
	Invalid Data	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
12 05	Invalid Query Type	
12 06	IP Signaling Series 3Card ID already configured	
12 07	Invalid Type	
12 08	Invalid State	Trying to set an invalid service state or the Matrixis already in this state For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
12 09	Invalid IPDC Usage option	Trying to set an invalid IPDC usage or the option is out of range
12 0A	Invalid IP Signaling Series 3 Card interface support	Trying to set an invalid IP Signaling Series 3 Card interface support
12 0B	Invalid Base Value	Trying to set an invalid base value for channels and spans
12 0C	IP Signaling Series 3 Card ID not configured	Response to Query
12 0D	IP Signaling Series 3 Card not in service	Response to Query
13 00	SIP Common Error	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 01	User Not Found	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 02	Invalid Call Handle	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 03	Invalid PPL Event	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 04	Invalid Data	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 05	Network Error	Remote end rejected the message. For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 06	Timer Expired	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 07	No more PPL state machines available	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 08	Invalid State	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 09	Invalid Time Slot	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 0A	VDAC Rejected	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 0B	Authentication Failed	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages.
13 0C	Call not in bearer free mode	
13 0D	Invalid Action Value	For SIP, used in <i>Route Control</i> and <i>PPL Event Request</i> messages. In <i>PPL Event Request</i> indicates the socket is not open so it cannot be closed.
13 12	DNS Server Disabled (NACK)	All <i>Route/Outseize Control</i> API messages are nacked with this response if the outbound SIP call requires a DNS Server lookup and the DNS is disabled.
14 01	Invalid Config Object Type	
14 02	Invalid or Out-of-Range Config Instance ID for the IP Signaling Series 3 Card	
14 03	Invalid Query Type	
14 04	Invalid TLV tag	
14 05	IP Signaling Series 3 Card Internal Error	
14 06	Invalid TLV value	
14 07	Invalid ICB	
14 08	Configuration was not completed	
14 09	IP Signaling Series 3 Card ID already created	
14 0A	Invalid State	Trying to set an invalid service state or the call server is already in this state

14 0B	CSP Matrix Series 3 Card ID already created	
14 0C	Invalid CSP Matrix Series 3 Card ID	
14 0D	Invalid Slot Number	
14 0E	IP Signaling Series 3 Card is not configured	
15 01	Gateway mode not supported over ring	Connecting gateway mode VoIP channel to B timeslot over ring is not supported
17 01	Invalid DSP Number	Used in messages <i>Service State Configure</i> , <i>DSP SIMM Configure</i>
17 02	File ID Not Found	Used in message <i>DSP Cache Modify</i> .
17 03	No Active Playback/Record Session	Used in messages <i>Play File Modify</i> , <i>Play File Stop</i> , <i>Record File Modify</i> , <i>Record File Stop</i>
17 04	Playback/Record Session in Incorrect State	Used in messages <i>Play File Modify</i> , <i>Record File Modify</i>
17 05	Invalid File ID for Configuration	Used in messages <i>Play File Start</i> , <i>Record File Start</i>
17 07	No Resources Due to DSP Overload	Used in messages <i>Resource Create</i> , <i>Play File Start</i> (to channel or conference), <i>Record File Start</i> (to channel or conference), <i>Conference Create</i> , <i>DSP Service Request</i> , <i>Collect Digit String</i> , <i>Recorded Announcement Connect</i> , <i>Connect Tone Pattern</i> , <i>Outpulse Digits</i>
17 0A	Unable to remove party from a conference	Used in <i>Resource Connect</i> and <i>Resource Disconnect</i> messages
17 0B	Unable to add party to a conference	Used in <i>Resource Connect</i> and <i>Resource Disconnect</i> messages.
17 0C	Channel not present in parent conference	Used in <i>Resource Connect</i> message
17 0D	Channel not present in child conference	Used in <i>Resource Disconnect</i> message
17 0E	Reached System Maximum Number of Conferences	Used in <i>Resource Create</i> and <i>Conference Create</i> messages.
17 11	Not supported in gateway mode	Used in messages <i>Connect to Conference</i> , <i>Resource Connect</i>

MSB 0x18 - Invalid B Channel State

The LSB indicates the current call state.

If the value is 0x1850 or above, it indicates the Layer 3 State. The Layer 3 state values depend on the signaling protocol. See the appropriate *.ppl file (CD ROM only) for Layer 3 state values, or contact Dialogic technical support.

If the value is lower than 0x1850, it indicates the Layer 4 State. The Layer 4 states are defined below. Some values are not backward-compatible with System Software versions earlier than 5.3.

18 00	Out of Service
18 01	Incoming Call
18 02	Wait For CSA in Incoming Call State
18 03	In Service Idle
18 04	Incoming Call, Wait for Host Connect
18 05	Outgoing Call, L3 Outseize Wait
18 06	Wait For CSA in Incoming Call Wait for Host State
18 07	Answered/Connected
18 08	L4 Clear ACK Wait, L3 Disconnect Received
18 09	L3 Clear Wait
18 0A	Busied out
18 0B	Outgoing Call Cut-thru
18 0C	Wait for CSA in Incoming Alerted State
18 0D	Wait for CSA in Incoming in Answered State
18 0E	Incoming Call Alerted
18 0F	L3 Clear Wait
18 10	Wait for CSA in Outgoing Cut-thru
18 11	Wait for CSA in Outgoing Alerted State

18 12	L4 Clear ACK Wait, L3 Clear Received
18 13	Outgoing Call Alerted
18 14	L4 Clear ACK Wait, L5 Clear Received
18 15	L5 Release Wait
18 16	Incoming Call, L4 Clear ACK Wait (Park Processing)
18 17	Incoming Call Alerted, L4 Clear ACK Wait (Park Processing)
18 18	Answered, L4 Clear ACK Wait (Park Processing)
18 19	Outgoing Alerted, L4 Clear ACK Wait (Park Processing)
18 1A	Outgoing Cut-thru, L4 Clear ACK Wait (Park Processing)
18 1B	Wait for CSA for Internal Routing
MSB 0x1D - Invalid A Channel State The LSB indicates the current call state. If the value is 0x1D50 or above, it indicates the Layer 3 State. The Layer 3 state values depend on the signaling protocol. See the appropriate *.ppl file (CD ROM only) for Layer 3 state values, or contact Dialogic technical support. If the value is lower than 0x1D50, it indicates the Layer 4 State. The Layer 4 states are defined below. Some values are not backward-compatible with System Software versions earlier than 5.3.	
1D 00	Out of Service
1D 01	Incoming Call
1D 02	Wait For CSA in Incoming Call State
1D 03	In Service Idle
1D 04	Incoming Call, Wait for Host Connect
1D 05	Outgoing Call, Layer 3 Outseize Wait For PPL Event Request message (0x0044): Outseize Acknowledgment Network Wait
1D 06	Wait For CSA in Incoming Call Wait for Host State
1D 07	Answered/ Connected
1D 08	L4 Clear ACK Wait, Layer 3 Disconnect Received For PPL Event Request message (0x0044): Layer 4 Release Wait
1D 09	Layer 3 Clear Wait For PPL Event Request message (0x0044): Network Release Wait
1D 0A	Busied out
1D 0B	Outgoing Call Cut-thru For PPL Event Request message (0x0044): Externally Outseized
1D 0C	Wait for CSA in Incoming Alerted State For PPL Event Request message (0x0044): Hold Acknowledge Wait
1D 0D	Wait for CSA in Incoming in Answered State For PPL Event Request message (0x0044): Layer 3 Answer Wait
1D 0E	Incoming Call Alerted For PPL Event Request message (0x0044): Layer 4 Answer Wait
1D 0F	L3 Clear Wait
1D 10	Wait for CSA in Outgoing Cut-thru For PPL Event Request message (0x0044): Layer 4 Recall Wait
1D 11	Wait for CSA in Outgoing Alerted State For PPL Event Request message (0x0044): Purge Response Wait
1D 12	L4 Clear ACK Wait, L3 Clear Received For PPL Event Request message (0x0044): Purge Wait

1D 13	Outgoing Call Alerted	
	For PPL Event Request message (0x0044): Park	
1D 14	L4 Clear ACK Wait, L5 Clear Received	
1D 15	L5 Release Wait	
1D 16	Incoming Call, L4 Clear ACK Wait (Park Processing)	
1D 17	Incoming Call Alerted, L4 Clear ACK Wait (Park Processing)	
1D 18	Answered, L4 Clear ACK Wait (Park Processing)	
1D 19	Outgoing Alerted, L4 Clear ACK Wait (Park Processing)	
1D 1A	Outgoing Cut-thru, L4 Clear ACK Wait (Park Processing)	
1D 1B	Wait for CSA for Internal Routing	
48 01	Invalid Number of TLVs	The number of TLVs is out of range.
48 02	Invalid Module Number	The module number is invalid for the message sent.
48 03	Invalid IP Address	The IP address out of range or an invalid class.
48 04	Invalid Subnet Mask	The subnet mask is out of range or is invalid for the IP address.
48 05	Duplicate IP Address	The IP address is already assigned to another module number.
48 06	Invalid TLV tag	The TLV tag is out of range.
48 07	Invalid Data Type	The Data Type is out of range.
48 08	Invalid TLV combination	The combination of TLVs is invalid.
48 09	Module Not Present	
48 11	Socket Incorporate Operation Error	
48 12	Invalid Parameter Length	
48 0A	Invalid IMMSG	
48 0B	Motherboard IP Address Not Configured	
48 0C	Invalid Ethernet Port	
48 0D	Invalid TLV Value	
48 0F	Socket bind to user error	
4D 01	Software key format not valid.	The first two bytes of the Product License field are not defined key types, or the product license contains invalid data.
4D 02	Data decrypted not valid.	A serial number decrypted from a product license cannot be matched against an existing serial number on a CSP.
4D 03	Product License - Insufficient Licensed Resources	
4D 3D	Product License - Invalid ICB Data	
4D 74	Invalid Card Type.	The line card that license was generated for does not support licensing
4D AA	Insufficient Hardware.	Not enough room for the number of licensed spans on the chassis
50 01	Response Timeout	
50 02	Null Buffer	
50 03	Queue Full	
50 04	Feature Disabled	
50 05	No ICBs	
50 06	Invalid ICB Type (Message Not Processed)	
50 07	Invalid ICB Type (Message Partially Processed)	
50 08	Invalid ICB Subtype (Message Not Processed)	
50 09	Invalid ICB Subtype (Message Partially Processed)	
50 0A	Invalid Message (Message Not Processed)	
50 0B	Invalid Message (Message Partially Processed)	
50 0C	Unauthorized Command	

50 0D	Incorrect ICB Data Length	
50 0E	Host Not Connected	
50 0F	Incorrect Host ID	
50 10	Reserved	
50 11	Maximum Number of Queries Exceeded	
50 12	Not used	
50 13	Not used	
50 14	Multi Host Download In Progress	
50 15	Multi Host Being Enabled, Wait 32 Sec	
	In the SS7 CLLI Query message (0x00EB): The message could not be processed for either of the following reasons: - Stack ID and CIC Group mismatch - Internal error	
50 16	Odd ICB Data Count (Extended API)	
50 17	Non-Unique Host ID	
	In the SS7 CLLI Query message (0x00EB): Invalid configuration data format, if the data format specified is not 0x01 (TLV format)	
50 18	Invalid ICB Subtype	
50 19	Host ID Assigned to Different Host	
50 1A	Invalid ICB Data Entry	
50 47	Invalid Ring Loop Timing.	Trying to set a node to be master-configurable, but the ring timing has already been derived, or trying to set ring timing on a master node or master-configurable node, or trying to set secondary timing on the EXNET-ONE card.
50 AA	Insufficient Hardware.	This response status is returned when trying to initiate the Enhanced Fault Tolerance Ring Mode, but the EXNET-ONE and I/O are installed. (These EXNET® cards cannot be used in the Enhanced Fault Tolerance Ring Mode).
50 C0	Action Denied.	A value of Action Denied (0xC0) is returned if the user is trying to set an EXNET-ONE card.
50 75	Invalid TLV Tag.	The TLV specified is not one of the 4 types allowed (Trunk Number, Local CLLI, Remote CLLI, Trunk Type)
50 CD	Invalid TLV Tag Length	
50 E0	SS7 Signaling Stack Not Configured	
50 F9	Invalid TLV Count. The TLV Count should be 0x04.	
51 00	ISUP Congestion	Local or remote ISUP congestion scenario. Only priority calls will be allowed in congestion state.
51 01	End of Route Table	
51 02	Retry Limit Exceeded	
51 03	Termination Error	
51 04	Purge	
51 05	No Destination Found	
51 06	Recursion	
51 07	ACK Wait Timer Expired	
51 08	No Common Resource Group Found	
51 0A	Termination Validation Error	
51 0B	Channel unavailable due to initialization or OOS	
51 0C	End of Entry Data	

51 0D	Invalid Routing Method	
51 0E	Invalid Resource Group Table	
51 0F	Invalid Route Table	
51 10	Reserved	
51 11	Invalid Resource Group	
51 12	Invalid Criteria	
51 13	Invalid Entry Data	No available routes
51 14	System Error	
51 15	Illegal Instruction	
51 1E	V5 ID Invalid	
51 1F	V5 User Port Invalid	
51 20	V5 User Port In Use	
51 21	V5 User Port Blocked	
51 22	V5 TS Alloc Failed	
51 23	V5 Timer Expiry	
51 24	V5 L3 Internal Error	
51 25	V5 Formie Invalid	
51 26	V5 Invalid Num of Formies	
51 28	V5 Unspecified	
51 29	V5 Access NW Fault	
51 2A	V5 Access NW Blocked	
51 2B	V5 Connection Present at PSTN up to a Diff V5TS	
51 2C	V5 Connection Present at V5TS to a Diff ISDN UPTS	
51 2D	V5 Connection Present at ISDN up to a Diff V5TS	
51 2F	V5 Dealloc Cannot Comp Incompatiable Data	
51 30	V5 Dealloc Cannot Comp V5TS Data Incompatible	
51 31	V5 Dealloc Cannot Comp Port Data Incompatible	
51 32	V5 Dealloc Cannot Comp Upts Data Incompatible	
51 33	V5 User Port Not Provisioned	
51 34	V5 TS Invalid Identified	
51 35	V5 Link Invalid Identified	
51 37	V5 TS Used as Physical C Channel	
51 38	V5 Link Blocked	
51 8F	Gatekeeper routed but no gatekeeper address	
51 90	H245 end session received	
51 91	RAS DRQ	
51 92	CALL PROCEEDING has protocol error	
51 93	H225 timer expired	
51 94	REL COMPLETE received	

51 95	Incoming H225 message has Q931 protocol error	
51 96	No Remote Alias Address or SRC IP/Port not Available	
51 97	H.323 Protocol Error (H.225, H.245, or RAS)	
51 98	H.225, H.245 Socket Open Fail	
51 99	Gatekeeper not Configured	
51 9A	LRQ Failed	
51 9B	ARQ Failed	
51 9C	No Associated Timeslot	
51 9D	DSP Resource Wait Timeout	
51 9E	Invalid DSP Resource Request	Resource already attached.
51 20	V5 ID Invalid	
51 21	V5 User Port Invalid	
51 22	V5 User Port Blocked	
51 23	V5 Timer Expiry	
51 24	Unexpected Clearing Received	
51 25	Invalid V5 Formatted IEs	
51 26	Invalid Number of V5 Formatted IEs	
52 01	Signaling Route Test (SRT) failed.	
52 02	Signaling Route Test Acknowledgment (SRTA) has an improper pattern.	
52 03	The SRTA was received on the wrong SLC. (This error code not supported for DDI).	
52 04	Link congested	
52 05	Link out of service	
52 06	Link not equipped	
52 07	Request was terminated by the Host	
52 08	SRT is already running	
52 09	System error	
52 0A	SRTC timed out	
52 0B	Received valid SRTA in wrong Link ID (This error code not supported for DDI)	
52 0C	Route not configured for this DPC	
52 81	Invalid module type for DPC/Stack/CIC combination. (Also used in the <i>PPL Timer Configure</i> message: 0x00CF)	
52 82	Message received for unassigned CIC.	
52 83	Only Extended API is supported for VCIC.	
If the MSB is 0x54, Error Detected in SCCP/TCAP, the LSB indicates the error as follows:		
54 00	Error Unknown	
54 01	Incorrect ICB	The maximum number of ICBs for the TCAP primitive set is 16.
54 02	Incorrect ICB Length or Parameter	
54 03	Incorrect or Missing Mandatory TCAP Parameters	
54 04	Incorrect or Missing Mandatory SCCP Parameter	
54 05	Invalid Primitive (Primitive Not Supported)	
54 06	Instance does not Exist	
54 07	Primitive Not Expected as this Time	
54 08	Mandatory Component Missing	
54 09	TCAP simultaneous active dialogue/ transaction/operations reached the maximum limit.	SS7 system busy condition (for CPU, memory or MCB).

54 0A	SSN is not Configured or not Active
54 0B	Maximum Length of TCAP Components for a Message Exceeded
55 00	<i>PPL Event Request: Error Unknown</i> <i>SCCPTCAP Configure: No More Status Info, or Status Unknown</i>
55 01	<i>PPL Event Request: Invalid ICB or a Mandatory ICB is missing</i> <i>SCCPTCAP Configure: Invalid Config Type</i>
55 02	<i>PPL Event Request: Incorrect ICB Length or Parameter</i> <i>SCCPTCAP Configure: Subsystem Configured</i>
55 03	<i>PPL Event Request: Incorrect or Missing Mandatory TCAP Parameter</i> <i>SCCPTCAP Configure: Subsystem Not Configured</i>
55 04	<i>PPL Event Request: Incorrect or Missing Mandatory SCCP Parameter</i> <i>SCCPTCAP Configure: Subsystem Allowed</i>
55 05	<i>PPL Event Request: Invalid Primitive (Primitive Not Supported)</i> <i>SCCPTCAP Configure: Subsystem Not Allowed</i>
55 06	<i>PPL Event Request: Instance does not Exist</i> <i>SCCPTCAP Configure: Invalid Option</i>
55 07	<i>PPL Event Request: Primitive Not Expected at this Time</i> <i>SCCPTCAP Configure: Exceeds minimum number of hosts for a Subsystem</i>
55 08	<i>PPL Event Request: Mandatory Component Missing</i> <i>SCCPTCAP Configure: Invalid Parameter</i>
55 09	<i>PPL Event Request: Resource Limitation</i> <i>SCCPTCAP Configure: Invalid Parameter Length</i>
55 0A	<i>PPL Event Request: SSN is not Configured or not Active</i> <i>SCCPTCAP Configure: Parameter Configured</i>
55 0B	<i>PPL Event Request: Maximum Length of TCAP Components for a Message Exceeded</i> <i>SCCPTCAP Configure: Parameter Not Configured</i>
55 0C	Invalid SCCP Upper Layer
55 0D	Maximum Active Subsystems Exceeded
55 0E	DPC Not Configured

6 PPL Component Information

Overview

Purpose This chapter contains information regarding PPL Components for PPL software development on the CSP.

PPL Component IDs

This section lists the PPL Component IDs used in PPL software development for the CSP. The component IDs are listed by protocol.

Important! All the PPL components listed in this section support the extended PPL table type except for those showing otherwise.

Component Modification	Components that are released for modification using the PPL Composer are marked with an asterisk (*).
T1	0x0003 T1 PPL Component* (Supports basic PPL table type only)
E1	0x0001 E1 PPL Component* (Supports basic PPL table type only)
Layer 4/Layer 5 Call Control PPL Information	0x0061 Channel Management*
	0x0062 Call Management*
	0x0063 Physical Connection Management*
	0x0064 Router*
	0x0084 Interworking
	0x0086 MCC Group
	0x0087 MCC Channel
SS7	L3P
	0x000F L3P CIC (CIC Call Control)*
	0x0010 L3P Link (Link Management)*

ISUP

0x0012 ISUP CPC (Call Processing Control) *

0x0013 ISUP SPRC (Signaling Procedure Control)*

0x0014 ISUP CCI (Continuity Check Incoming)

0x0015 ISUP CRI (Continuity Recheck Incoming)

0x0016 ISUP BLS (Blocking/Unblocking Signal Sending)

0x0017 ISUP BLR (Blocking/Unblocking Signal Reception)

0x0018 ISUP CRS (Circuit Reset Sending)

0x0019 ISUP CRR (Circuit Reset Reception)

0x001A ISUP UCIC (Unequipped CIC Reception)

0x001B ISUP CGRS (Circuit Group Reset Sending)

0x001C ISUP CGRR (Circuit Group Reset Reception)

0x001D ISUP GBUS (Circuit Group Blocking/Unblocking Sending)

0x001E ISUP GBUR (Circuit Group Blocking/Unblocking Reception)

0x001F ISUP HGBR (Hardware Oriented Circuit Group Blocking/
Unblocking Reception)

0x0042 ISUP HLB (Hardware Failure Oriented Locally Blocking State)

0x0043 ISUP HRB (Hardware Failure Oriented Remotely Blocking)

0x0044 ISUP CRCR (Continuity Recheck Reception)

0x0045 ISUP MGBS (Maintenance Oriented Circuit Group Blocking/
Unblocking Sending)

0x0046 ISUP MGBR (Maintenance Oriented Circuit Group Blocking/
Unblocking Reception)

0x0047 ISUP HGBS (Hardware Oriented Circuit Group Blocking/
Unblocking Sending)

0x0076 ISUP CQS(Circuit Query Sending)

0x0077 ISUP CQR (Circuit Query Receiving)

0x0078 ISUP CVS (Circuit Validation Sending)

0x0079 ISUP CVR (Circuit Validation Receiving)

0x0080 ISUP CCO (Continuity Check Outgoing)

0x0081 ISUP CRCS (Continuity Check Resending)

0x0082 ISUP DCO (Demand Continuity Outgoing)

0x0083 ISUP CRO (Continuity Recheck Outgoing)

0x0085 ISUP SSC (Simple Segmentation Control)

0x00A8 ISUP ACC (Automatic Congestion Control)

TUP

0x0011 L3P TUP (Telephone User Part)*
0x0052 TUP CPC (Call Processing Control)*
0x0053 TUP SPRC (Signaling Procedure Control)*
0x0054 TUP BLR (Blocking/Unblocking Signal Reception)
0x0055 TUP BLS (Blocking/Unblocking Signal Sending)
0x0057 TUP CRI (Continuity Recheck Incoming)
0x0058 TUP CRS (Circuit Reset Sending)
0x0059 TUP CGRR (Circuit Group Reset Reception)
0x005A TUP CGRS (Circuit Group Reset Sending)
0x005B TUP MBUS (Maintenance Block/Unblock Sending)
0x005C TUP MBUR (Maintenance Block/Unblock Receiving)
0x005D TUP HBUS (Hardware Block/Unblock Sending)
0x005E TUP HBUR (Hardware Block/Unblock Receiving)
0x005F TUP SBUS (Software Block/Unblock Sending)
0x0060 TUP SBUR (Software Block/Unblock Receiving)

SSUTR2

0x0011 L3P SSUTR2
0x0052 SSUTR2 CPC (Call Processing Control)
0x0053 SSUTR2 SPRC (Signaling Procedure Control)

PPL Component Addressing

Overview This section lists the PPL Components and the associated AIBs used for PPL messages.

Guidelines The following are guidelines for the information in the tables later in this section.

- PPL timer and configuration bytes are stored on a *per channel* basis.
- The *PPL Transmit Signal Configure* message (0xD2) is applies to the E1 and T1 protocols.

The tables later in this section show the AIBs used to address the various PPL components in these PPL-related API messages listed below:

- *PPL Assign* (0xD1)
- *PPL Audit Configure* (0xDC)
- *PPL Audit Query* (0xDD)
- *PPL Configure* (0xD7)
- *PPL Data Query* (0xDE)
- *PPL Event Indication* (0x43)
- *PPL Event Request* (0x44)
- *PPL Timer Configure* (0xCF)

The *PPL Transmit Signal Configure* message is not included in the tables because it uses the Channel address AIB only.

For span/channel addressed state machines, the following messages can use either a single entity or range address method:

- *PPL Assign* (0xD1)
- *PPL Configure* (0xD7)
- *PPL Timer Configure* (0xCF)
- *PPL Transmit Signal Configure* (0xD2)

For span/channel addressed state machines, the following messages use a single entity address method only:

- *PPL Audit Query* (0xDD)
- *PPL Data Query* (0xDE)

- *PPL Event Indication* (0x43)
- *PPL Event Request* (0x44)

For information on AIB formats, refer to the *Address Elements* chapter.

PPL Events

The *PPL Event Indication* and *PPL Event Request* messages are used to send and receive additional call processing data about the call.

PPL Event Request

This message is initiated by the host, and sends an external event directly to the specified PPL component.

PPL Event Indication

This message enables the PPL component on the CSP to report external events to the host application.

The *PPL Event Request* and *PPL Event Indication* messages must include the PPL component and event. They can include optional data in an ICB.

ICB subtype values can include Layer 3 (ISDN, SS7, SIP, or H.323) parameters. Refer to the *Information Control Blocks* chapter.

E1/T1

7 Timers and Filters

Overview

Purpose This chapter lists the Timers and Filters used in the EXS API for the CSP.

The CSP expects timers in API messages to be configured in 10-millisecond units, Most Significant Byte (MSB) first and Least Significant Byte (LSB) second.

To determine a timer of 10 seconds, you must convert the time to millisecond units (s = seconds, ms = milliseconds):

$10\text{ s} = 10,000\text{ ms} = 1,000\text{ 10-ms units}$

$1,000 = 3E8$ in hexadecimal, which is expressed as 0x03, 0xE8.

You can determine timers using the conversion chart in the following section.

Timer Conversion Table

Use the table below to convert times into the format explained above.

The length of your timer is listed in the *Time* column and the timer's hexadecimal equivalent is listed in the *MSB* and *LSB* columns.

Time	MSB	LSB
50 ms	0x00	0x05
100 ms	0x00	0x0A
150 ms	0x00	0x0F
200 ms	0x00	0x14
250 ms	0x00	0x19
300 ms	0x00	0x1E
350 ms	0x00	0x23
400 ms	0x00	0x28
450 ms	0x00	0x2D
500 ms	0x00	0x32
550 ms	0x00	0x37
600 ms	0x00	0x3C
650 ms	0x00	0x41
700 ms	0x00	0x46
750 ms	0x00	0x4B
800 ms	0x00	0x50
850 ms	0x00	0x55
900 ms	0x00	0x5A
950 ms	0x00	0x5F
1050 ms	0x00	0x69
1100 ms	0x00	0x6E
1150 ms	0x00	0x73
1200 ms	0x00	0x78

Time	MSB	LSB
1250 ms	0x00	0x7D
1300 ms	0x00	0x82
1350 ms	0x00	0x87
1400 ms	0x00	0x8C
1450 ms	0x00	0x91
1500 ms	0x00	0x96
1550 ms	0x00	0x9B
1600 ms	0x00	0xA0
1650 ms	0x00	0xA5
1700 ms	0x00	0xAA
1750 ms	0x00	0xAF
1800 ms	0x00	0xB4
1850 ms	0x00	0xB9
1900 ms	0x00	0xBE
1950 ms	0x00	0xC3
2000 ms	0x00	0xC8
1 s	0x00	0x64

38 s	0x0E	0xD8
39 s	0x0F	0x3C

T1 Filters

The *Filter/Timer Configure* message modifies approximately 100 combined timers and filters. There are approximately 14 signal scanning filters, 63 signal scanning timers, and 36 transmit signal timers for T1 trunk types.

Filter values are in 10 millisecond decimal units. If there is no value in a field, the filter does not apply.

Signaling Scanning Filters

Signal Scanning Filters (table below) define the duration that an expected signaling condition is expected to be valid before it is declared to have occurred.

ID	PPL Timer No.	Signal Scanning Filter	E&M	FXO LS	FXS LS	FXO GS	FXS GS
0x01	0x01	Preseize	10			10	
0x02	0x02	Inseize	15	600	20	600	100
0x03	0x03	Modified Incoming Release	70	500	70	60	70
0x04	0x04	Modified Outgoing Release	70		70	60	70
0x05	0x05	Normal Incoming Release	70		70	60	70
0x06	0x06	Normal Incoming Release w/Flash	102		102	102	102
0x07	0x07	Normal Outgoing Release	70		70	60	70
0x08	0x08	Normal Outgoing Release w/Flash	102		102	102	102
0x09	0x09	Post Inseize Acknowledgment					
0x0A	0x0A	Outseize Acknowledgment	10		18	10	18
0x0B	0x0B	Outseize Answer	35				
0x0C	0x0C	Outseize Dial Signal End	4				
0x0D	0x0D	First Release	70		70	15	
0x0E	0x0E	ANI Req Offhook	20		20		20

Signaling Scanning Timers Signal Scanning Timers (table below) define the minimum and maximum acceptable durations for signaling condition to exist from the point they are declared valid.

Timer values are in 10 millisecond decimal units. If there is no value in a field, the timer does not apply.

ID	PPL Timer No.	Signal Scanning Timer	E&M	FXO LS	FXS LS	FXO GS	FXS GS
0x01	0x15	Inseize Complete				604	
0x02	0x16	Post Inseize Complete					22
0x03	0x17	Start Normal Outgoing Release	0				
0x04	0x18	Start Normal Incoming Release	0

Important! * To configure the DTMF timers for H.323 use *PPL Timer Configure 0x00CF* and then refer to the *API Developers Guide: IP, H.323 Chapter*.

Transmit Signaling Timers

Transmit Signaling Timers (table below) define the durations used when the system is generating signaling or tones. With the T-ONE card, timer values can be modified using either the PPL Timer Configure message

Timer values are in 10 millisecond decimal units. If there is no value in a field, the timer does not apply.

ID	PPL Timer No.	Transmit Signaling Timer	E&M	FXO LS	FXS LS	FXO GS	FXS GS
0x01	0x5B	Wink (1 or KP) Duration	20				
0x02	0x5C	Flash Duration	60	60	60	60	60
0x03	0x5D	Primary Outseize Signaling					
0x04	0x5E	Outseize Signaling Complete	30	30			
0x05	0x5F	Delay Dial Signal Start	7				
0x06	0x60	Fixed Pause	7	7		7	7
0x07	0x61	Timed Answer		50		50	
0x08	0x62	Ringing On Duration			200		
0x09	0x63	Ringing Off Duration			400		
0x0A	0x64	Wink 1 Minimum Transmit Delay	8				
0x0B	0x65	Wink 2 Minimum Transmit Delay	80				
0x0C	0x66	Wink 2 Maximum Transmit Delay	1,150				
0x0D	0x67	Wink 2 Transmit Duration	20				
0x0E	0x68	Wink 3 Minimum Transmit Delay	10				
0x0F	0x69	Wink 3 Maximum Transmit Delay	40				
0x10	0x6A	Wink 3 Transmit Duration	20				
0x11	0x6B	Wink 4 Minimum Transmit Delay	8				

ID	PPL Timer No.	Transmit Signaling Timer	E&M	FXO LS	FXS LS	FXO GS	FXS GS
0x12	0x6C	Wink 4 Maximum Transmit Delay	40				
0x13	0x6D	Wink 4 Transmit Duration	20

E1 Timers

The table below shows the timers used with the E1 component (0x01).

Timer ID	Description: (State Used); Timer Description	Default Value (10 ms)
1	(S19) Incoming Layer 4 busy out Acknowledge wait	400
2	(S2) Incoming Stage 1 FWD digit receive wait	2000
3	(S3) Incoming Stage 2 FWD digit receive wait	2000
4	(S4) Incoming Stage 3 FWD digit receive wait	2000
5	(S5) Incoming Stage 4 FWD digit receive wait	2000
6	(S13) Layer 4 Connect wait	24,000
7	(S14) Layer 4 wait	400
8	(S21) Clear Forward (idle line signaling) wait	1500
9	(S3) Incoming Stage 2 Initial FWD digit receive wait	2000
10	(S2) Incoming Stage 1 Initial FWD digit receive wait	2000
11	(S5) Incoming Stage 4 Initial FWD digit receive wait	2000
12	(S4) Incoming Stage 3 Initial FWD digit receive wait	2000
13	(S15) Layer 3 Circuit Release wait	10
14	(S18) Layer 3 Circuit Release wait	10
15	(S6) Host Control Wait	6000
16	(S13) Layer 3 Connect wait	24000
17	(S29) Seize Acknowledge wait	400
18	(S31) Time to wait before transmitting idle signal after detecting glare	10
19	(S32) Time to wait before looking for idle signal after transmitting idle signal after detecting glare	10
20	(S39) Outgoing Stage 1 BWD R2 signal wait	1500
21	(S39) Outgoing Stage 1 Initial BWD R2 signal wait	1500
22	(S41) Outgoing Stage 2 BWD R2 signal wait	1500
23	(S41) Outgoing Stage 2 Initial BWD R2 signal wait	1500

Timer ID	Description: (State Used); Timer Description	Default Value (10 ms)
24	(S43) Outgoing Stage 3 BWD R2 signal wait	1500
25	(S43) Outgoing Stage 3 Initial BWD R2 signal wait	1500
26	(S45) Outgoing Stage 4 BWD R2 signal wait	1500
27	(S45) Outgoing Stage 4 Initial BWD R2 signal wait	1500
28	(S46) Outgoing wait for answer	24000
29	(S48) Outgoing Layer 4 Clear wait	400
30	(S49) Outgoing idle line signal wait	12000
31	(S50) Outgoing idle line signal wait after glare detected	12000
32	(S24) Host Control wait	24000
33	(S33) Time to wait for Clear Forward after glare detected	1000
34	Receive line signaling filter	4
36	(S6, S24) Incoming BWD R2 Cycle Complete Event wait	400
38	(S10) Time to wait for idle line signaling after invalid line signal detected while receiving FWD R2 digits	2000
39	(S22) Layer 3 Clear Forward wait	300
40	(S39) Outgoing Stage 1 BWD A signal wait after sending all of Stage 1 FWD digits	2000
41	(S2, S3, S4, S5) FWD R2 digits receive wait when String Collection Data field in Inpulsing Parameters Configure is set to 0xFF	144
43	R2 Cycle Complete Event wait	200
45	(S43) Time to wait for next BWD R2 signal when stage 3 digits have been outpulsed	2000
