# Revision History

This revision history summarizes the changes made in each published version of this document.

Document No.	Publication Date	Description of Revisions
05-1843-005	September 2007	Made global changes to reflect Dialogic brand.
05-1843-004	May 2006	<p><code>dcb_GetPartyParm()</code>, and <code>dcb_SetPartyParm()</code>: Added functions to support direct application control of output volume (per party). Also added cross references to these functions.</p> <p><b>Function Information:</b> Added note to the following functions indicating that they are <b>not</b> supported on HMP software: <code>dcb_GetAtiBitsEx()</code>, <code>dcb_GetPartyParm()</code>, and <code>dcb_SetPartyParm()</code>.</p> <p><b>Error Codes:</b> Added HMP-only error code (EDT_HSIBRIDGEERR). Also added to <code>dcb_addtoconf()</code> and <code>dcb_estconf()</code> functions.</p> <p><code>dcb_setbrdparm()</code> and <code>dcb_getbrdparm()</code>: Changed the description of the MSG_ACTID parameter to indicate that it enables/disables active talker identification (or notification) and not the active talker feature itself (IPY00006584 = PTR 36199 and IPY00010946 = PTR 36323).</p>
05-1843-003	February 2005	<p><code>dcb_GetAtiBitsEx()</code> and <code>dcb_gettalkers()</code> functions: Described the functions and the active talker feature more accurately (PTR 34210).</p> <p><code>dcb_getbrdparm()</code> and <code>dcb_setbrdparm()</code> functions: Described the active talker parameters more accurately (PTR 34210), including stating that by default it is enabled for DM3 architecture boards, removing the MSG_ALGORITHM parameter (PTR 34382), which does not apply to DM3, and clarifying the MSG_ACTTALKERNOTIFYINTERVAL parameter, providing default value, units, etc. Also, clarified the MSG_TONECLAMP parameter (PTR 34672).</p> <p><code>dcb_CreateBridge()</code>, <code>dcb_dsprescount()</code>, and <code>dcb_estconf()</code> functions: . Added details on maximum conference size, maximum number of conference resources, and conference bridging and clarified descriptions.</p> <p><code>dcb_remfromconf()</code> function: Added note to <b>cdt</b> parameter that the party attributes are ignored.</p> <p>MS_CDT data structure: Added details and clarified description of structure and attributes. Added note that MSPA_PARTYTONECLAMP attribute is used to enable tone clamping on a per-party basis. Added note on using MSPA_MODEXMITONLY to add a music resource to a conference in a background music application, such as a dating chat line application where two callers talk while music plays in the background.</p>

## Revision History

Document No.	Publication Date	Description of Revisions
05-1843-002	August 2004	<p>Global changes: Removed references to operating system <code>errno</code> global variable and <code>errno.h</code> from example code and include files lists (PTR 28014).</p> <p>Error Codes chapter: For <code>EDT_SYSTEM</code>, corrected error code description to say "operating system error."</p> <p>Added <code>E_MSSYSTEM</code> to list of codes.</p> <p><code>MS_CDT</code> data structure: Use echo cancellation on analog lines, especially with Coach/Pupil (PTR 32072).</p> <p>Enable echo cancellation using <code>dcb_estconf( )</code> or <code>dcb_addtoconf( )</code>; you cannot use <code>dcb_setcde( )</code> to enable or disable echo cancellation (PTR 29542).</p> <p><code>dcb_setcde( )</code> function: Cannot use <code>dcb_setcde( )</code> to enable or disable echo cancellation (PTR 29542).</p> <p><code>dcb_estconf( )</code> function: Maximum value for <code>numpty</code> is 24. (PTR 31432)</p>
05-1843-001	September 2002	<p>Initial version of document. Much of the information contained in this document was previously published in the <i>Audio Conferencing Software Reference for Linux</i>, document number 05-0510-004 and the <i>Dialogic Audio Conferencing Software Reference for Windows</i>, document number 05-0512-002.</p>

# About This Publication

---

The following topics provide information about this publication:

- [Purpose](#)
- [Applicability](#)
- [Intended Audience](#)
- [How to Use This Publication](#)
- [Related Information](#)

## Purpose

This publication provides a reference to the functions, parameters and data structures in the audio conferencing library. These functions and parameters allow you to build audio conferencing applications.

This publication is a companion document to the *Dialogic® Audio Conferencing API Programming Guide*, the *Dialogic® Standard Runtime Library API Programming Guide* and the *Dialogic® Standard Runtime Library API Library Reference*.

## Applicability

This document version (05-1843-005) is published for Dialogic® Host Media Processing (HMP) Software Release 3.1LIN.

This document may also be applicable to other software releases (including service updates) on Linux or Windows® operating systems. Check the Release Guide for your software release to determine whether this document is supported.

## Intended Audience

This information is intended for:

- Distributors
- System Integrators
- Toolkit Developers
- Independent Software Vendors (ISVs)
- Value Added Resellers (VARs)
- Original Equipment Manufacturers (OEMs)

## How to Use This Publication

This document assumes that you are familiar with the Linux or Windows® operating system and the C programming language.

The information in this publication is organized as follows:

- **Chapter 1, “Function Summary by Category”** introduces the various categories of audio conferencing API functions and provides a brief description of each function.
- **Chapter 2, “Function Information”** provides an alphabetical reference to the audio conferencing API functions.
- **Chapter 3, “Events”** includes an alphabetical reference to events that may be returned by the audio conferencing library.
- **Chapter 4, “Data Structures”** provides an alphabetical reference to the data structures used by the audio conferencing library.
- **Chapter 5, “Error Codes”** presents a listing of error codes that may be returned by the audio conferencing library.

## Related Information

See the following for additional information:

- <http://www.dialogic.com/manuals/> (for Dialogic® product documentation)
- <http://www.dialogic.com/support/> (for Dialogic technical support)
- <http://www.dialogic.com/> (for Dialogic® product information)

The Dialogic® Audio Conferencing library functions provide the building blocks for creating conferencing applications with Dialogic® DM3 architecture boards. These functions can be divided into the following categories:

- [Auxiliary Functions](#) . . . . . 9
- [Conference Management Functions](#) . . . . . 9
- [Configuration Functions](#) . . . . . 10
- [Device Management Functions](#) . . . . . 11

## 1.1 Auxiliary Functions

The following functions add flexibility while using the active talker feature, and allow your application to get/set the status of audio conferencing API events:

- [dcb\\_evtstatus\(\)](#)  
gets or sets the status of a process-wide event, not a specific device handle
- [dcb\\_GetAtiBitsEx\(\)](#)  
gets active talkers for all conferences on a DSP
- [dcb\\_gettalkers\(\)](#)  
gets active talkers and party attributes for a specific conference

## 1.2 Conference Management Functions

The following functions are used to manage all conference activities:

- [dcb\\_addtoconf\(\)](#)  
adds one conferee to an existing conference
- [dcb\\_CreateBridge\(\)](#)  
creates a conference bridge
- [dcb\\_delconf\(\)](#)  
deletes an individual conference
- [dcb\\_DeleteAllConferences\(\)](#)  
deletes all established conferences
- [dcb\\_DeleteBridge\(\)](#)  
deletes a conference bridge
- [dcb\\_estconf\(\)](#)  
establishes a conference

## Function Summary by Category

### **dcb\_getcde()**

retrieves the attributes of a conference (conference descriptor element)

### **dcb\_getcnflist()**

gets a list of conferees in a conference

### **dcb\_GetPartyParm()**

gets current parameters for a conferee

### **dcb\_monconf()**

adds a monitor to a conference

### **dcb\_remfromconf()**

removes a conferee from a conference

### **dcb\_setcde()**

sets the attributes of a conferee

### **dcb\_SetPartyParm()**

gets current parameters for a conferee

### **dcb\_unmonconf()**

removes the monitor from a conference

## 1.3 Configuration Functions

These functions set the conference board or digital signal processor (DSP) device parameters, check the status of the conference board or DSP device parameter settings, and retrieve or set specific information about DSPs or conferences. The following configuration functions exist in the audio conferencing library:

### **dcb\_dsprecount()**

retrieves the free conferencing resource count

### **dcb\_getbrdparm()**

gets conference board device parameters

### **dcb\_getdigitmsk()**

reads the digit event message mask

### **dcb\_setbrdparm()**

changes conference board device parameters

### **dcb\_setdigitmsk()**

sets the digit event message mask

## **1.4 Device Management Functions**

These functions are used to open and close conference devices. A conference device can be a board or an individual DSP on a board. Before using any audio conferencing library functions, a conference device must be opened. Each time a device is successfully opened using **dcb\_open()**, the function returns a unique device handle.

### **dcb\_open()**

opens a conference device

### **dcb\_close()**

closes a conference device

## ***Function Summary by Category***

This chapter provides an alphabetical reference to the functions in the Dialogic® Audio Conferencing API library.

## 2.1 Function Syntax Conventions

The audio conferencing functions use the following syntax:

```
int dcb_function(devh, parameter1, ...parameterN)
```

where:

**int**

refers to the data type integer

**dcb\_function**

represents the function name. All conferencing functions begin with “dcb”

**devh**

represents the device handle, which is a numerical reference to a conference device. A device handle is obtained when a conference device is opened, it is used for all operations on that device.

**parameter1**

represents the first parameter

**parameterN**

represents the last parameter

**dcb\_addtoconf( )** — add one conferee to an existing conference

## dcb\_addtoconf( )

**Name:** int dcb\_addtoconf(devh, confid, cdt)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
MS\_CDT \*cdt • pointer to conference descriptor element

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_addtoconf( )** function adds one conferee to an existing conference.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>confid</b>	specifies the conference to which the conferee will be added
<b>cdt</b>	points to an <b>MS_CDT</b> data structure that defines the attributes of the added conferee

- Notes:** 1. Only one conferee can be added at a time using this function.  
2. Invoking this function uses one conferencing resource each time a conferee is successfully added to a conference.

When a conferee is added to a conference, the TDM bus time slot number to listen to is returned in the **chan\_its** field of the **MS\_CDT** data structure. The **chan\_attr** field in the **MS\_CDT** structure is redefined in the *msilib.h* file as follows:

```
#define chan_its chan_attr
```

The **chan\_its** value must be used by the application to listen to the conferenced signal.

### ■ Cautions

This function fails when:

## ***add one conferee to an existing conference — dcb\_addtoconf()***

- The device handle specified is invalid.
- Too many parties are specified for a single conference.
- The conference identifier is invalid.
- Conference resources are not available on the DSP.

### ■ **Errors**

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

**Note:** **Dialogic® Host Media Processing (HMP) Software Only:** An EDT\_HSIBRIDGEERR indicates that an error occurred in creating a conference or adding a party to a confrence because parties are on a different bus fabric than the conference and a Host Streaming Interface (HSI) bridge connection could not be created between Dialogic® HMP Software and the board. You may be able to recover from this error by waiting for an HSI bridge connection to become available when parties are removed and/or conferences are deleted.

### ■ **Example**

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

#define NUM_PARTIES    2

main()
{
    int dspdevh;                /* Conference board DSP device descriptor */
    int tsdevh1, tsdevh2, tsdevh3; /* Time slot device descriptor */
    MS_CDT cdt[NUM_PARTIES];    /* Conference descriptor table */
    int confid;                /* Conference identifier */
    SC_TSINFO tsinfo;          /* Time slot information structure */
    long scts;                 /* TDM bus time slot */

    /* Open conference board 1, DSP 1 device */
    if ((dspdevh = dcb_open("dcbB1D1",0)) == -1) {
        printf( "Cannot open dcbB1D1: system error/n");
        exit(1);
    }

    /* Assume conference board is connected to a DTI via TDM bus. */

    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1: system error/n");
        exit(1);
    }

    /* Fill in the time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;
}
```

## **dcb\_addtoconf( ) — add one conferee to an existing conference**

```
/* Get the TDM bus transmit time slot of tsdevh1 */
if (dt_getxmitslot(tsdevh1, &tsinfo) == -1) {
    printf("Error Message = %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

/* Set up CDT structure */

## dcb\_close()

**Name:** int dcb\_close(devh)

**Inputs:** int devh • valid board or DSP device handle

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Device Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_close()** function closes the conference device previously opened by **dcb\_open()**. The devices are either conference boards or individual DSPs on the conference board. The **dcb\_close()** function releases the device handle. Refer to the *Dialogic® Audio Conferencing API Programming Guide* for complete information about device names.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the board or DSP device was opened using <b>dcb_open()</b>

### ■ Cautions

- This function fails if the device handle is invalid.
- The **dcb\_close()** function affects only the link between the calling process or thread and the device. Other processes or threads are unaffected by **dcb\_close()**.
- If event notification is active for the device to be closed, call the Standard Runtime Library **sr\_dishdlr()** function to disable the event handler prior to calling **dcb\_close()**.
- A call to **dcb\_close()** does not affect the configuration of the conferencing board.

### ■ Errors

The **dcb\_close()** function does not return errors in the standard return code format. If an error occurred during the **dcb\_close()** call, a -1 will be returned, and it indicates a operating system error.

■ **Example**

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcbllib.h"

main()
{
    int dspdevh;          /* DSP device descriptor variable */
    /* Open conference board 1, DSP 2 device */
    if ((dspdevh = dcb_open("dcbB1D2",0)) == -1) {
        printf("Cannot open DSP dcbB1D2: system error/n");
        exit(1);
    }

    /* Continue Processing */

    /* Done processing - close device */
    if (dcb_close(dspdevh) == -1) {

## dcb\_CreateBridge( )

**Name:** int dcb\_CreateBridge(hSrlDeviceA, nConferenceIDA, hSrlDeviceB, nConferenceIDB, Bridgecdt, unMode, rfu)

**Inputs:**

int hSrlDeviceA	• valid DSP device handle of the master conference
int nConferenceIDA	• conference identifier for the master conference
int hSrlDeviceB	• valid DSP device handle of the conference that will be bridged to the master conference
int nConferenceIDB	• conference identifier of the conference that will be bridged to the master conference
TS_BRIDGECDT * Bridgecdt	• pointer to a conference bridge descriptor element
unsigned short unMode	• mode of the function
void *rfu	• void pointer that is reserved for future use

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Conference Management

**Mode:** synchronous or asynchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_CreateBridge( )** function establishes a bridge between two conferences. A bridge is a link between conferences that allows each conferee within the distinct conferences to communicate as though they were part of a single conference. A bridge connects two conferences together by adding a secondary conference to a master conference as though it were an individual NULL conferee. A bridge consumes two conference resources (one in each conference).

Parameter	Description
<b>hSrlDeviceA</b>	specifies the valid device handle for the master conference obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>nConferenceIDA</b>	indicates the conference identifier number of the master conference
<b>hSrlDeviceB</b>	specifies the valid DSP device handle used by the conference that will be bridged to the master conference
<b>nConferenceIDB</b>	indicates the conference identifier number of the conference that will be bridged to the master conference

Parameter	Description
<b>Bridgecdt</b>	points to the <a href="#">TS_BRIDGECDT</a> data structure that defines the attributes of the conference bridge
<b>unMode</b>	<p>specifies whether the function should run asynchronously or synchronously. Possible values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>EV_ASYNC</b> – Function runs in asynchronous mode. Returns -1 to indicate failure to initiate. Returns 0 to indicate success and then generates either the <b>DCBEV_BRIDGEESTABLISHED</b> termination event to indicate successful completion (conference bridge established), or the <b>DCBEV_ERREVT</b> in case of error. The <b>DCBEV_BRIDGEESTABLISHED</b> event will have the <b>TS_BRIDGECDT</b> data structure as its associated data. The <b>nBridgeID</b> element in this structure can be used to identify the bridge. The <b>DCBEV_ERREVT</b> event will have the <b>TS_BRIDGECDT</b> data structure as its associated data. The <b>BridgeID</b> element in this structure can be used to identify the bridge</li> </ul> <p><i>Note:</i> Use the Standard Runtime Library event management functions to handle the termination events.</p> <ul style="list-style-type: none"> <li>• <b>EV_SYNC</b> – Function runs in synchronous mode. Returns -1 on failure and 0 on success.</li> </ul>
<b>rfu</b>	reserved for future use. Set this parameter to <b>NULL</b> .

- Notes:**
1. Conference bridging can be used to effectively expand a conference beyond the maximum size allowed by your particular configuration. Before a conference reaches its maximum size, create a second (master) conference and then connect the two conferences via a bridge.
  2. The total number of conference resources, as well as other conference resource limitations if any exist (such as the maximum conference size), depends upon either your particular board and its media load or the resource configuration of your Dialogic® HMP resource license. For specific conferencing resource information applicable to a particular board and its media load, see the Configuration Guide associated with your release.
  3. Each conference bridge that is established consumes one conferencing resource within the master conference and one conferencing resource within the conference that is being bridged to the master conference.
  4. It is possible to bridge together conferences that use the same DSP. In this case, the **hSrlDeviceA** and **hSrlDeviceB** parameters are the same.
  5. The coach/pupil feature does not span conference bridges. Coach and pupil must be in the same conference.
  6. The active talker feature does not span conference bridges; that is, there is no active talker summing across conference bridges and active talkers are reported separately for each conference.

#### ■ Cautions

This function fails when:

- An invalid device handle is specified.
- Conference resources are not available on the DSP.

## ***dcb\_CreateBridge()* — establish a conference bridge**

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in `dtilib.h`, `msilib.h` or `dcplib.h`.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/

## dcb\_DeleteAllConferences()

**Name:** int dcb\_DeleteAllConferences(devh, mode, rfu)

**Inputs:** int devh • valid DSP device handle  
unsigned short mode • mode of the function  
void\* rfu • void pointer that is reserved for future use

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous/asynchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_DeleteAllConferences()** function deletes all established conferences. This function is provided for recovery purposes. A typical use would be if an application had to be restarted due to an abnormal termination: rather than downloading the firmware to re-initialize the boards, this function could be called to delete all conferences that might be left active in the firmware.

Parameter	Description
<b>devh</b>	indicates the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>mode</b>	specifies whether the function should run asynchronously or synchronously. Possible values are as follows: <ul style="list-style-type: none"><li>• EV_ASYNC – Function runs in asynchronous mode. Returns -1 to indicate failure to initiate. Returns 0 to indicate successful initiation and then generates either the DCBEV_DELALLCONF termination event to indicate successful completion (all conferences deleted), or the DCBEV_ERREVT in case of error.</li></ul> <p><i>Note:</i> Use the Standard Runtime Library event management functions to handle the termination events.</p> <ul style="list-style-type: none"><li>• EV_SYNC – Function runs in synchronous mode. Returns -1 on failure and 0 on success.</li></ul>
<b>rfu</b>	reserved for future use. Set this parameter to NULL.

**Note:** Calling this function frees all resources in use by all the conferences on the specified DSP device.

## ■ Cautions

- This function fails when the specified device handle is invalid.
- This function is intended for application program recovery purposes. (The **dcb\_delconf()** function is intended for standard conference management purposes and should be used with the appropriate **xx\_unlisten()** routing functions.)
- In a multi-threaded or multi-process environment, DCB functions should not be invoked at the same time **dcb\_DeleteAllConferences()** is called.
- When this function is executed, it will not perform **xx\_unlisten()** operations upon devices listening to conference time slots. It is the application's responsibility to perform unrouting using **xx\_unlisten()** functions.

## ■ Errors

if this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, "Error Codes"](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example A

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>

#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

int dspdevh=0;

int DeleteAllConferences(void);

void main(void)
{
    char DeviceName[16];
    sprintf(DeviceName,"dcbB1D1");
    printf("Trying to open device = %s\n",DeviceName);
    if ( (dspdevh = dcb_open(DeviceName, 0)) == -1) {
        printf("Cannot open device %s: system error/n", DeviceName);
        exit(1);
    }
    else {
        printf("Open successfull for %s... dspdevh=0x%x\n",DeviceName,dspdevh);
    }

    /* Establish Conferences and Continue Processing */

    /* Delete all Active Conferences */
    DeleteAllConferences();

    /* Done processing - Close device */
    if ( dcb_close(dspdevh) == -1) {
        printf("Cannot close device %s: system error/n", DeviceName);
        exit(1);
    }
    else {
```

## ***dcb\_DeleteAllConferences()*** — delete all established conferences

```
    printf("dcb_close successfull ... dspdevh=0x%x\n",dspdevh);
}
} // main() ends

int DeleteAllConferences()
{
    void *RFU=0;
    if (dcb_DeleteAllConferences(dspdevh, EV_SYNC, RFU) == -1)
    {
        printf("dcb_DeleteAllConferences failed for %s. Error message = %s",
            ATDV_NAMEP(dspdevh), ATDV_ERRMSGP(dspdevh));
        return(-1);
    }
    else
    {
        printf("dcb_DeleteAllConferences successfull for %s... \n",
            ATDV_NAMEP(dspdevh));
    }
    return(0);
} //DeleteAllConferences ends
```

## **dcb\_DeleteBridge()**

**Name:** int dcb\_DeleteBridge(hSrlDeviceA, nConferenceIDA, hSrlDeviceB, nConferenceIDB, Bridgecdt, unMode, rfu)

**Inputs:**

int hSrlDeviceA	• valid DSP device handle of the master conference
int nConferenceIDA	• conference identifier for the master conference
int hSrlDeviceB	• valid DSP device handle of the conference that is bridged to the master conference
int nConferenceIDB	• conference identifier of the conference that is bridged to the master conference
TS_BRIDGECDT *Bridgecdt	• pointer to a conference bridge descriptor element
unsigned short unMode	• mode of the function
void *rfu	• void pointer that is reserved for future use

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** Asynchronous or synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_DeleteBridge()** function deletes a bridge that has been established between two conferences, but does not delete the individual conferences. The conferences that were connected via the conference bridge still exist after the bridge has been deleted, you must call the **dcb\_delconf()** to delete any remaining conferences.

<b>Parameter</b>	<b>Description</b>
<b>hSrlDeviceA</b>	specifies the valid device handle for the master conference obtained when the DSP device was opened using <b>dcb_open()</b>
<b>nConferenceIDA</b>	indicates the conference identifier number of the master conference
<b>hSrlDeviceB</b>	specifies the valid DSP device handle used by a conference that is bridged to the master conference
<b>nConferenceIDB</b>	indicates the conference identifier number of a conference that is bridged to the master conference

Parameter	Description
<b>Bridgecdt</b>	points to the <a href="#">TS_BRIDGECDT</a> data structure that defines the attributes of the conference bridge
<b>unMode</b>	<p>specifies whether the function should run asynchronously or synchronously. Possible values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>EV_ASYNC</b> – Function runs in asynchronous mode. Returns -1 to indicate failure to initiate. Returns 0 to indicate successful initiation and then generates either the <b>DCBEV_BRIDGEREMOVED</b> termination event to indicate successful completion (conference bridge deleted), or the <b>DCBEV_ERREVT</b> in case of error. The <b>DCBEV_BRIDGESTABLISHED</b> event will have the <b>TS_BRIDGECDT</b> data structure as its associated data. The <b>BridgeID</b> element in this structure can be used to identify the bridge. The <b>DCBEV_ERREVT</b> event will have the <b>TS_BRIDGECDT</b> data structure as its associated data. The <b>BridgeID</b> element in this structure can be used to identify the bridge</li> </ul> <p><b>Note:</b> Use the Standard Runtime Library event management functions to handle the termination events.</p> <ul style="list-style-type: none"> <li>• <b>EV_SYNC</b> – Function runs in synchronous mode. Returns -1 on failure and 0 on success.</li> </ul>
<b>rfu</b>	reserved for future use. Set this parameter to NULL.

### ■ Cautions

This function fails when:

- A specified device handle is invalid.
- A conference identifier is invalid.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

#define NUM_PARTIES 2
```

## **dcb\_DeleteBridge()** — delete a conference bridge

## dcb\_estconf( )

**Name:** int dcb\_estconf(devh, cdt, numpty, confattr, confid)

**Inputs:**

int devh	• valid DSP device handle
MS_CDT *cdt	• pointer to conference descriptor table
int numpty	• initial number of parties in the conference
int confattr	• conference attributes
int *confid	• pointer to the conference identifier

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
mslib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_estconf( )** function establishes a conference between parties. A conference is associated with a DSP and all resources used by the conference are on that DSP. When **dcb\_estconf( )** returns successfully, **confid** will contain the conference identification number for use in all further modifications to that conference.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>cdt</b>	points to the conference descriptor table. The conference descriptor table is an array of <b>MS_CDT</b> data structures which define the attributes of the conference parties.
<b>numpty</b>	indicates the initial number of parties in the conference. The maximum value is 24, but the maximum conference size may be lower depending upon your board and its media load or the resource configuration of your Dialogic® Host Media Processing (HMP) resource license (see “Notes” that follow).

Parameter	Description
<b>confattr</b>	indicates a bitmask describing the properties of all parties in the conference. Valid values are as follows: <ul style="list-style-type: none"> <li>• MSCA_ND – All parties in conference are notified by a tone if another conferee is added or removed from the conference.</li> <li>• MSCA_NULL – Conference has no special attributes.</li> </ul> <i>Note:</i> The default MSCA_NULL must be used if the MSCA_ND conference attribute is not specified.
<b>confid</b>	points to the conference identifier number

- Notes:*
1. Calling this function causes **numpty** resources to be used when the conference is successfully established.
  2. This function may be used to initially establish a conference. You must use **dcb\_addtoconf()** or **dcb\_monconf()** to increase the size of the conference.
  3. The maximum value for the **numpty** parameter is 24. If the maximum conference size is greater than 24 parties, you can use the **dcb\_estconf()** function to create a 24-party conference, and then use the **dcb\_addtoconf()** function to add parties one at a time.
  4. If the maximum conference size is exceeded, the function generates an E\_MSCNFLMT error (exceeds conference limit).
  5. The total number of conference resources, as well as other conference resource limitations if any exist (such as the maximum conference size), depends upon either your particular board and its media load or the resource configuration of your Dialogic® HMP resource license. For specific conferencing resource information applicable to a particular board and its media load, see the Configuration Guide associated with your release.
  6. Conference bridging can be used to effectively expand a conference beyond the maximum size allowed by your particular configuration. Before a conference reaches its maximum size, create a second (master) conference and then connect the two conferences via a bridge.

For each member of the conference, the TDM bus time slot number to listen to is returned in the `chan_its` field of the `MS_CDT` data structure. The `chan_attr` field in the `MS_CDT` structure is redefined in the `msilib.h` file as follows:

```
#define chan_its chan_attr
```

The `chan_its` value must be used by the application to listen to the conferenced signal.

## ■ Cautions

This function fails when:

- An invalid device handle is specified.
- Conference resources are not available on the DSP.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

## ***dcb\_estconf()* — establish a conference**

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcplib.h*.

**Note:** **Dialogic® Host Media Processing (HMP) Software Only:** An EDT\_HSIBRIDGEERR indicates that an error occurred in creating a conference or adding a party to a conference because parties are on a different bus fabric than the conference and a Host Streaming Interface (HSI) bridge connection could not be created between Dialogic® HMP Software and the board. You may be able to recover from this error by waiting for an HSI bridge connection to become available when parties are removed and/or conferences are deleted.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/

## **dcb\_evtstatus()**

**Name:** int dcb\_evtstatus(event, action, status)

**Inputs:** int event • event identifier  
int action • action to be performed  
int \*status • pointer to status of event generation

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Auxiliary

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_evtstatus()** function gets or sets the status of a process-wide event. Certain features of the audio conferencing software are board-level features in that they are enabled or disabled on a per board basis. Process-wide events are enabled or disabled once for all devices used by that process.

<b>Parameter</b>	<b>Description</b>
<b>event</b>	indicates the specified process-wide event
<b>action</b>	specifies whether the event status is to be set or retrieved. Possible values are as follows: <ul style="list-style-type: none"><li>• SET_EVENT</li><li>• GET_EVENT</li></ul>
<b>status</b>	If the event status is being set, ON or OFF is passed to the function in this parameter. If the event status is being retrieved, this parameter will contain ON or OFF when the function returns.

The **event** parameter must be set to MSG\_RESTBL. MSG\_RESTBL controls the Resource Table Update event generation. The resource assignment table is the mapping of resources to conferees. When this event notification is enabled, and the application makes a change to the assignment of resources on a conferencing board, a DCBEV\_CTU event is generated. The updated resource table will be returned as the event data. Refer to the code example for details.

## ■ Cautions

**dcb\_evtstatus()** is a process-wide function and does not have a device-handle as one of its parameters. Any event set ON or OFF is set for all devices used by the process, not for any particular device.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

#define MAX_PTY 32
#define TABLE_SIZE 192

DCB_CT res_table[MAX_PTY]; /* DCB_CT structure array */

void handler()
{
    int size = sr_getevtlen();
    char *datap = (char *)sr_getevtdatap();
    int event_type = (int)sr_getevttype();

    printf("Event occurred on %s : Data size = %d : Data is at 0x%x\n",
           ATDV_NAMEP(sr_getevtdev()), size, datap);

    if (event_type == DCBEV_CTU) {
        memcpy(res_table, datap, TABLE_SIZE);
    }
    else {
        printf("unexpected event generated\n");
    }
}

main()
{
    int bddevh, dspdevh; /* conference board and DSP device descriptors */
    unsigned long atibits; /* Active talker bits */
    int mode = SR_POLLMODE; /* Standard Runtime Library function-call mode */
    unsigned int status; /* conference board feature status */

### ■ Description

The **dcb\_GetAtiBitsEx( )** function returns active talker indicators for all conferences on a DSP device at the time the function is called (i.e., who the active talkers are at a given moment). The current number of active talkers is returned in **numpty**, with information identifying the active talkers returned in **ActiveTalkerInd**.

**Note:** This function is not supported on Dialogic® Host Media Processing (HMP) Software.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>numpty</b>	points to the number of active talkers indicators (elements in <b>ActiveTalkerInd</b> ).
<b>ActiveTalkerInd</b>	points to an array of <b>DCB_CT</b> structures where active talker indicators are returned, which identify the active talkers

- Notes:**
1. The developer must allocate and deallocate an array of **DCB\_CT** data structures large enough to store information on the number of active talkers.
  2. Active talker information is associated with the DSP device handle. The information is invalid upon closing the device.

## ■ Cautions

- This function is not supported on Dialogic® Host Media Processing (HMP) Software.
- The snapshot of information provided by **dcb\_GetAtiBitsEx()** is accurate for a split second. This information may not be accurate by the time the application processes it.
- This function fails when the device handle is invalid.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

const int MAX_ACTIVETALKERBITS = 120;

void main(void)
{
    char DeviceName[16];
    char BoardName[16];
    int dspdevh=-1,BoardDevHandle=-1;

    sprintf(BoardName,"dcbE1");
    printf("Trying to open device = %s\n",BoardName);
    if ( (BoardDevHandle = dcb_open(BoardName, 0)) == -1) {
        printf("Cannot open device %s: system error/n", BoardName);
        getchar();
        exit(1);
    }
    else {
        printf("Open successfull for %s ... BoardDevHandle=0x%x\n",BoardName,BoardDevHandle);
    }

    /* Set Active Talker Identification ON */
    int nStatus=ACTID_ON;
    if(dcb_setbrdparm(BoardDevHandle,MSG_ACTID,(void*)&nStatus)==-1) {
        printf("dcb_setbrdparm->MSG_ACTID->Error Setting Board Parm for %s : ERROR = %s\n",
            ATDV_NAMEP(BoardDevHandle),ATDV_ERRMSGP(BoardDevHandle));
        /* process error */
    }
    else {
        printf("SetBoardParm->MSG_ACTID->Success Setting Board Parm for %s\n",
            ATDV_NAMEP(BoardDevHandle));
    }
}
```

## **dcb\_GetAtiBitsEx()** — get active talkers for all conferences on a DSP

```
if ( dcb_close(BoardDevHandle) == -1) {
    printf("Cannot close device %s: system error/n", ATDV_NAMEP(BoardDevHandle));
    /* process error */
    exit(1);
}
else {
    printf("dcb_close successfull for %s... BoardDevHandle=0x%x\n",
        ATDV_NAMEP(BoardDevHandle),BoardDevHandle);
}

sprintf(DeviceName,"dcbB1D1");
printf("Trying to open device = %s\n",DeviceName);
if ( (dspdevh = dcb_open(DeviceName, 0)) == -1) {
    printf("Cannot open device %s: system error/n", DeviceName);
    /* process error */
    exit(1);
}
else {
    printf("Open successfull for %s... dspdevh=0x%x\n",DeviceName,dspdevh);
}

/* Establish Conferences and Continue Processing */

/* GetAtiBitsEx */
int nCount,i=0;
DCB_CT ActiveTalkerIndicators[MAX_ACTIVETALKERBITS];
void * RFU=0;
if(dcb_getatibitsEx(dspdevh, &nCount, ActiveTalkerIndicators, RFU)==-1)
{
    printf("GetAtiBits->dcb_getatibitsEx failed on %s Error = %s\n",
        ATDV_NAMEP(dspdevh),ATDV_ERRMSGP(dspdevh));
    /* process error */
}
else
{
    printf("GetAtiBits->dcb_getatibitsEx Successful on %s Count = %d\n",
        ATDV_NAMEP(dspdevh),nCount);
    for(i=0;i<nCount;i++)
    {
        printf("i = %d ConferenceID = 0x%x ChanNum = %d ChanSel = 0x%x\n",
            i,ActiveTalkerIndicators[i].confid,
            ActiveTalkerIndicators[i].chan_num,
            ActiveTalkerIndicators[i].chan_sel);
    }
}

/* Done processing - Close device */
if ( dcb_close(dspdevh) == -1) {
    printf("Cannot close device %s: system error/n", ATDV_NAMEP(dspdevh));
    /* process error */
    exit(1);
}
else
    printf("dcb_close successfull for %s... dspdevh=0x%x\n",
        ATDV_NAMEP(dspdevh),dspdevh);
} // main() ends
```

## dcb\_getbrdparm()

**Name:** int dcb\_getbrdparm(devh, param, valuep)

**Inputs:** int devh • valid board device handle  
unsigned char param • device parameter defined name  
void \* valuep • pointer to the returned parameter value

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Configuration

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_getbrdparm()** function retrieves a conference board parameter value. Each parameter has a symbolic name that is defined in *dcblib.h*. The parameters are disabled by default and must be enabled using the **dcb\_setbrdparm()** function.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the board device was opened using <b>dcb_open()</b>
<b>param</b>	indicates the parameter to be examined
<b>valuep</b>	points to the integer or <b>MS_VOL</b> data structure where the value of the parameter specified in <b>param</b> should be returned

The valid values for **param** and **valuep** are shown below:

**Note:** For **MSG\_ACTID**, **MSG\_ACTTALKERNOTIFYINTERVAL**, and **MSG\_TONECLAMP**, **valuep** points to an integer value. For **MSG\_VOLDIG**, **valuep** points to an **MS\_VOL** data structure.

**MSG\_ACTID** (Active Talker Identification)

Enables or disables Active Talker Identification (or Notification). Possible values are **ACTID\_ON** or **ACTID\_OFF**. **ACTID\_ON** is the default. This parameter does not enable or disable the active talker *feature*, which is always enabled. It only disables the *notification* to the application program. The active talker *feature* sums the 3 most active talkers in a conference, so that the conversation doesn't get drowned out when too many people talk at once. Active talker *notification* provides data on active talkers through the **dcb\_gettalkers()** and **dcb\_GetAtiBitsEx()** functions, which can be used by an application program to identify active talkers; for example, to provide a visual display highlighting the active talkers in a

conference. Active talkers are determined by their loudness; i.e., the strength of their “non-silence” energy.

**Note:** In some cases, it is desirable to inactivate the active talker feature, such as for a background music application program. Although you cannot directly disable the active talker *feature*, you can set the noise level threshold by which signals are recognized as either speech or noise. For more information, see the background music feature in the *Dialogic® Audio Conferencing API Programming Guide*.

#### MSG\_ACTTALKERNOTIFYINTERVAL (Active Talker Notification Interval)

Changes the interval specifying how frequently the Active Talker status is updated. The value is specified in 10 ms units. The default value is 100 (in 10 ms units), which results in a 1-second interval, and the maximum value is 1000, which results in a 10-second interval.

**Note:** If a low value is used, it can affect system performance due to the more frequent updating of the status (which results in a high quantity of internal notification messages). If a high value is used, it will result in less frequent updating of status, but the non-silence energy of a conferee may not be reported if it occurs between notification updates. For example, if the notification interval is set to 2 seconds and a conferee only says “yes” or “no” quickly in between notifications, that vocalization by the conferee will not be reported.

#### MSG\_TONECLAMP (Tone Clamp Activation)

Enables tone clamping for all parties to reduce the amount of DTMF tones heard in a conference. Tone clamping applies to the transmitted audio going into the conference and does not affect DTMF function. It is meaningful only in the full duplex or the transmit-only mode. Possible values are TONECLAMP\_ON or TONECLAMP\_OFF. TONECLAMP\_OFF is the default. (To enable on a per-party basis, set the MSPA\_PARTY\_TONECLAMP attribute in the [MS\\_CDT](#) structure for the party.) Even with tone clamping, DTMF tones may be heard by conferees if the application encourages the user to repeatedly press DTMF tones; for example, press 9 to raise volume.

#### MSG\_VOLDIG (Volume Control Digits)

Defines the volume control status and volume up/down/reset digits as defined in the MS\_VOL data structure.

### ■ Cautions

- The value of the parameter returned by this function is currently an integer or an MS\_VOL data structure. **valuep** is the address of the value, but should be cast as a void pointer when passed in the value field.
- This function fails when:
  - The device handle is invalid.
  - The parameter specified is invalid.
  - The DSP device handle is used.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function [ATDV\\_LASTERR\(\)](#) or [ATDV\\_ERRMSGP\(\)](#) to retrieve either the error code or a pointer to the error description, respectively.

## ***dcb\_getbrdparm()* — retrieve a conference board parameter value**

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcplib.h*.

### ■ **.Example**

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcplib.h"

main()
{
    int brddevh; /* Board dev descriptor variables */
    int actid_status; /* Active talker identification status (ON/OFF) */
    MS_VOL volume; /* Volume control structure */

    /* Open DCB board 1 */
    if ((brddevh = dcb_open("dcbB1",0)) == -1) {
        printf( "Cannot open dcbB1: system error/n");
        exit(1);
    }

    /* Retrieve Status (ON/OFF) of the Active Talker Identification */
    if (dcb_getbrdparm(brddevh, MSG_ACTID, (void *)&actid_status) == -1) {
        printf("Error getting board param:0x%x\n ", ATDV_LASTERR(brddevh));
        exit(1);
    }
    printf("Active talker identification is %s\n", (actid_status ? "ON" : "OFF"));

    /* Retrieve Information on Volume Control Feature */
    if (dcb_getbrdparm(brddevh, MSG_VOLDIG, (void *)&volume) == -1) {
        printf("Error getting volume control parameters : 0x%x\n ",
            ATDV_LASTERR(brddevh));
        exit(1);
    }
    printf("Volume Control is %s\n", (volume.vol_control ? "ON" : "OFF"));
    printf("The Up Digit is %d\n", volume.vol_up);
    printf("The Reset Digit is %d\n", volume.vol_reset);
    printf("And the Down Digit is %d\n", volume.vol_down);

    /* Continue processing */

    if (dcb_close(brddevh)== -1){
        printf("Cannot close dcbB1: system error/n");
        exit(1);
    }
}
```

**dcb\_getcde()** — retrieve the attributes of a conferee

## dcb\_getcde()

**Name:** int dcb\_getcde(devh, confid, cdt)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
MS\_CDT \*cdt • pointer to a conference descriptor table element

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_getcde()** function retrieves the properties of a conferee in an existing conference.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	indicates the conference identifier number
<b>cdt</b>	points to an <b>MS_CDT</b> data structure that specifies the attributes of the conferee

This function requires that the conferee's `chan_num` and `chan_sel` be specified in the **MS\_CDT** data structure. On successful completion, the conferee's attributes will be returned in the `chan_attr` field.

**Note:** This function must be invoked multiple times if the attributes of more than one conferee are desired.

### ■ Cautions

This function fails when:

- The device handle specified is invalid.
- An invalid conference identifier is specified.
- The queried conferee is not in the conference.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcbli.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/

## **dcb\_getcnflist()**

**Name:** int dcb\_getcnflist(devh, confid, numpty, cdt)

**Inputs:**

int devh	• valid DSP device handle
int confid	• conference identifier
int *numpty	• pointer to the conferee count
MS_CDT *cdt	• pointer to conference descriptor table

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_getcnflist()** function retrieves total number of parties within a conference and a conferee list. The list contains specific information about each conferee in that conference, including each conferee's TDM bus transmit time slot number, selector, and conferee attribute description. The list is not returned in any specific order.

<b>Parameter</b>	<b>Description</b>
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	specifies the conference identifier
<b>numpty</b>	points to the conferee count
<b>cdt</b>	points to the conference descriptor table. The conference descriptor table is an array of <b>MS_CDT</b> data structures, which specify the attributes of the conference parties.

**Note:** The application is responsible for allocating an MS\_CDT table with sufficient elements.

When a conference is being monitored, one member of the conference list will be the monitor. chan\_num for the monitor will equal 0x7FFF and chan\_sel will be MSPN\_TS.

If you call this function to get the number of conferees in a conference that contains a conference bridge, the return value will be the total number of conferees in the conference plus one for the

conference bridge, or in the case of a master conference, one for each bridge that is connected to the master conference.

### ■ Cautions

- This function fails when an invalid conference identifier is specified.
- It is the responsibility of the application to allocate enough memory for the conference descriptor table. There must be an MS\_CDT element allocated for each conferee description returned by this function. For example, if a conference was started with four conferees, and three conferees were added later, the MS\_CDT array must be able to hold seven entries.

**Note:** Even though *dcb\_monconf()* does not use the CDT structure, the array must have an additional structure if the conference is being monitored.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function *ATDV\_LASTERR()* or *ATDV\_ERRMSGP()* to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

#define NUM_PARTIES    2

main()
{
    int dspdevh;          /* DSP device handle variable */
    int tsdevh1, tsdevh2; /* DTI TDM bus time slot device handles */
    int partycnt;        /* Pointer to the number of conferenced parties */
    MS_CDT cdt[32];     /* Conference descriptor table */
    SC_TSINFO tsinfo;
    int confid;         /* Conference identifier */
    long scts;         /* Returned TDM bus time slot */
    int i;              /* Loop index */

    /* Open board 1 DSP 1 device */
    if ((dspdevh = dcb_open("dcbB1D1",0)) == -1) {
        printf( "Cannot open dcbB1D1: system error/n");
        exit(1);
    }

    /* Assume the conference board connected to a DTI via TDM bus. */

    /* Open board 1, tslot 1 */
    if ((tsdevh1 = dti_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1: system error/n");
        exit(1);
    }
}
```

## **dcb\_getcnflist()** — retrieve a conferee list

```
/* Prepare the TDM bus time slot information structure */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarrayp = &scts;

/* Retrieve the TDM bus transmit time slot for tsdevh1 */
if (dt_getxmitslot(tsdevh1, &tsinfo) == -1){
    printf("Error Message = %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

/* Set up the CDT structure */
cdt[0].chan_num = (int)scts;          /* scts is the TDM bus time slot */
cdt[0].chan_sel = MSPN_TS;          /* returned from dt_getxmitslot() */
cdt[0].chan_attr = MSPA_NULL;      /* Conferee has no special attributes */

/* Open board 1, tslot 2 */
if ((tsdevh2 = dt_open("dtiB1T2",0)) == -1) {
    printf("Cannot open dtiB1T2: system error/n");
    exit(1);
}

/* Retrieve the TDM bus transmit time slot for tsdevh2 */
if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
    printf("Error Message = %s" , ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* TDM bus time slot to be conferenced */
cdt[1].chan_num = (int)scts;          /* scts is the SCbus time slot */
cdt[1].chan_sel = MSPN_TS;          /* returned from dt_getxmitslot() */
cdt[1].chan_attr = MSPA_PUPIL;      /* Conferee may be coached later */

/* Establish 2 party conference */
if (dcb_estconf(dspdevh, cdt, NUM_PARTIES, MSCA_ND, &confid) == -1){
    printf("Error Message = %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Do a listen to the TDM bus listen time slot for tsdevh1 */

## dcb\_getdigitmsk()

**Name:** int dcb\_getdigitmsk(devh, confid, bitmaskp)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
unsigned int \* bitmaskp • pointer to digit bitmask

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Configuration

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_getdigitmsk()** function returns the digit mask for a specified conference. The values set in the mask corresponds to the digits which, when received, will cause a DCBEV\_DIGIT event to be generated to the application.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	indicates the conference identifier number
<b>bitmask</b>	points to the digit bitmask

**Note:** If MSG\_VOLDIG is enabled to give transparent volume control to the conferees, the digits for volume increase, decrease, and reset will not cause digit events to be generated. As a result, the application will not know if the volume changes.

### ■ Cautions

This function fails when:

- The device handle specified is invalid
- An invalid conference identifier is specified

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

**dcb\_GetPartyParm( )** — retrieve the current parameters for a conferee

## dcb\_GetPartyParm( )

**Name:** int dcb\_GetPartyParm(hSrlDevice, nConferenceID, Partycdt, unPartyParm, Value, rfu)

**Inputs:**

int hSrlDevice	• valid DSP device handle
int nConferenceID	• conference identifier
MS_CDT *Partycdt	• pointer to conference descriptor table element
unsigned int unPartyParm	• the parameter whose value is to be retrieved
void *Value	• the address of the integer or structure containing the value(s) to be assigned
void *rfu	• void pointer reserved for future use

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_GetPartyParm( )** function retrieves the current parameters for a conferee (conference party).

**Note:** This function is **not** supported on Dialogic® Host Media Processing (HMP) Software.

Parameter	Description
<b>hSrlDevice</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>nConferenceID</b>	specifies the conference identifier number
<b>Partycdt</b>	points to an <b>MS_CDT</b> data structure that defines the attributes of the conferee <b>Note:</b> The chan_attr field of the MS_CDT structure is not used and is ignored by the <b>dcb_SetPartyParm( )</b> function.
<b>unPartyParm</b>	specifies the parameter whose value is to be retrieved
<b>Value</b>	points to the integer or structure containing the value to be assigned to <b>unPartyParm</b>
<b>rfu</b>	void pointer reserved for future use

## retrieve the current parameters for a conferee — `dcb_GetPartyParm()`

For a list of valid values for `unPartyParm` and `Value`, see the `dcb_SetPartyParm()` function description.

### ■ Cautions

- This function is **not** supported on Dialogic® Host Media Processing (HMP) Software.
- This function fails when:
  - The device handle specified is invalid.
  - The conference identifier is invalid.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in `dtilib.h`, `msilib.h` or `dcblib.h`.

### ■ Example

```
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#define NUM_PARTIES 2

**dcb\_gettalkers()** — *get active talkers and party attributes for a specific conference*

## dcb\_gettalkers( )

**Name:** int dcb\_gettalkers(devh, confid, numpty, talkers)

**Inputs:**

int devh	• valid DSP device handle
int confid	• conference identifier
int * numpty	• pointer to number of active talkers
MS_CDT * talkers	• pointer to array of talker descriptions (party attributes)

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Auxiliary

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_gettalkers()** function retrieves information about the conferees actively talking in the conference specified by the DSP device and the **confid**. The current number of active talkers is returned in **numpty**, with descriptive information on each talker returned in **talkers**. The returned array of **MS\_CDT** structures contains the active talker party attributes. The array has **numpty** number of elements. Each **MS\_CDT** structure describes one active talker. **chan\_num** contains the transmit time slot number of the actively talking conferee. **chan\_sel** specifies that the conferee is a TDM bus time slot. For active talker retrieval, **chan\_attr** is not used.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	indicates the conference identifier number
<b>numpty</b>	points to number of active talkers
<b>talkers</b>	points to the array of <b>MS_CDT</b> data structures that contain active talker descriptions

- Notes:**
1. Active talker information is associated with the DSP device handle. The information is invalid upon closing the device.
  2. The developer must allocate and deallocate an array of **MS\_CDT** data structures large enough to store information on the number of active talkers.
  3. The list is not returned in any specific order.

## ***get active talkers and party attributes for a specific conference — dcb\_gettalkers()***

### ■ Cautions

This function fails when:

- The device handle specified is invalid.
- An invalid conference identifier is specified.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

### ■ Example

```

## dcb\_monconf( )

**Name:** int dcb\_monconf(devh, confid, lts)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
long \*lts • pointer to listen TDM bus time slot

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_monconf( )** function adds a monitor to a conference. A monitor has no input in the conference.

This function places the monitored signal on the TDM bus. Several parties can listen to the monitored signal simultaneously.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>confid</b>	specifies the conference identifier number
<b>lts</b>	points to the returned listen TDM bus time slot. The monitored signal is present on this time slot.

- Notes:**
1. There may only be one monitor in a conference. The monitor feature does not span conference bridges.
  2. Calling this function uses one conferencing resource.
  3. It is the application's responsibility to listen to the time slot on which the monitored signal is transmitted.

A monitor counts as one of the parties in the conference. If all the resources on the DSP are already in use, it is not possible to monitor the conference. When a conference is deleted, the conference monitor is also deleted.

## ■ Cautions

This function fails when:

- The device handle specified is invalid.
- The conference is full.
- Conference resources are not available on the DSP.
- The conference identifier is invalid.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcplib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcplib.h"

#define NUM_PARTIES    2

main()
{
    int dspdevh;          /* DSP device handle */
    int tsdevh1, tsdevh2; /* DTI time slot device handles */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    int confid;          /* Conference identifier */
    long lts, scts;      /* TDM bus listen/transmit time slots */
    SC_TSINFO tsinfo;    /* Time slot information structure */

    /* Open conference board 1, DSP 3 device */
    if ((dspdevh = dcb_open("dcbB1D3",0) == -1) {
        printf("Cannot open dcbB1D3: system error/n");
        exit(1);
    }

    /* Open DTI board 1, tslot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf("Cannot open dtiB1T1: system error/n");
        exit(1);
    }

    /* Prepare the TDM bus time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    /* Get TDM bus transmit time slot of DTI tsdevh1 */
    if (dt_getxmitslot(tsdevh1, &tsinfo) == -1){
        printf("Error Message = %s",ATDV_ERRMSGP(tsdevh1));
        exit(1);
    }
}
```

## ***dcb\_monconf()*** — add a monitor to a conference

```
/* Set up CDT structure */
cdt[0].chan_num = (int)scts; /* SCbus transmit time slot returned */
cdt[0].chan_sel = MSPN_TS; /* ...from dt_getxmitslot() */
cdt[0].chan_attr = MSPA_NULL; /* Conferee has no special attributes */

/* Open DTI board 1, tslot 2 */
if ((tsdevh2 = dt_open("dtiB1T2",0)) == -1) {
    printf("Cannot open dtiB1T2: system error/n");
    exit(1);
}

/* Get transmit time slot of DTI tsdevh2 */
if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Set up CDT structure */
cdt[1].chan_num = (int)scts; /* SCbus time slot returned */
cdt[1].chan_sel = MSPN_TS; /* from dt_getxmitslot() */
cdt[1].chan_attr = MSPA_NULL; /* Conferee has no special attributes */

/* Open DTI board 1, tslot 3 */
if ((tsdevh1 = dt_open("dtiB1T3",0)) == -1) {
    printf("Cannot open dtiB1T3: system error/n");
    exit(1);
}

/* Establish 2 party conference */
if (dcb_estconf(dspdevh, cdt, NUM_PARTIES, MSCA_ND, &confid) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Do a listen for the tsdevh1 */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarrayp = &cdt[0].chan_lts;

if (dt_listen(tsdevh1,&tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

/* Do a listen for the tsdevh2 */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarrayp = &cdt[1].chan_lts;

if (dt_listen(tsdevh2,&tsinfo) == -1){
    printf("Error Message = %s",ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Now monitor the conference on time slot lts */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarrayp = &lts;

if((dcb_monconf(dspdevh,confid,&lts)) == -1){
    printf("Error Message = %s",ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Assume that a DTI time slot, tsdevh3, is a monitor */
if (dt_listen(tsdevh3,&tsinfo) == -1){
    printf("Error Message = %s",ATDV_ERRMSGP(tsdevh3));
    exit(1);
}
```

## ***add a monitor to a conference — dcb\_monconf()***

```
/* Perform an unlisten() to end monitor listening */
if (dt_unlisten(tsdevh3) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh3));
    exit(1);
}

/* Now remove the monitor from the conference */
if((dcb_unmonconf(dspdevh,confid)) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* 'Unlisten' the TDM bus time slots */
if (dt_unlisten(tsdevh1) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

if (dt_unlisten(tsdevh2) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Delete the conference */
if(dcb_delconf(dspdevh, confid) == -1) {
    printf("Cannot delete conference %d : Error Message = %s", confid,
        ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Close all open devices */
if (dt_close(tsdevh1) == -1){
    printf("Error closing tsdevh1\n");
    exit(1);
}

if (dt_close(tsdevh2) == -1){
    printf("Error closing tsdevh2\n");
    exit(1);
}

if (dt_close(tsdevh3) == -1){
    printf("Error closing tsdevh3\n");
    exit(1);
}

if (dcb_close(dspdevh) == -1){
    printf("Cannot close dcbB1D3: system error/n");
    exit(1);
}
}
```

## **dcb\_open( ) — open a conferencing device**

### **dcb\_open( )**

**Name:** int dcb\_open(name, rfu)

**Inputs:** char \*name                      • pointer to device name to open  
int rfu                                   • reserved for future use

**Returns:** device handle on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Device Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

#### ■ **Description**

The **dcb\_open( )** function opens a conference device and returns a unique handle to identify the device. The device may be a conference board or a DSP on the board. All subsequent references to the opened device must be made using the device handle. Refer to the *Dialogic® Audio Conferencing Programming Guide* for complete information about device names.

<b>Parameter</b>	<b>Description</b>
<b>name</b>	points to an ASCII string that contains the name of a valid DSP device or board device
<b>rfu</b>	reserved for future use. Set this parameter to 0.

- Notes:**
1. If a parent process opens a device and enables events, there is no guarantee that the child process will receive a particular event.
  2. No action can be performed on a conference device until it is opened.

#### ■ **Cautions**

This function fails when:

- The device name is invalid.
- The system has insufficient memory to complete the open.

#### ■ **Errors**

The **dcb\_open( )** function does not return errors in the standard return code format. If an error occurred during the **dcb\_open( )** call, a -1 will be returned. If a call to **dcb\_open( )** is successful, the return value will be a handle for the opened device.

■ **Example**

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

main()
{
    int bddevh;

    /* open board 1*/
    if ((bddevh = dcb_open("dcbB1", 0)) == -1) {
        printf("Cannot open device dcbB1: system error/n");
        exit(1);
    }
    else
        printf("Board %s is OPEN\n", ATDV_NAMEP(bddevh));

    /* Done processing - Close device */
    if (dcb_close(bddevh) == -1) {
        printf("Cannot close dcbB1: system error/n");
        exit(1);
    }
}
```

**dcb\_remfromconf()** — remove a conferee from a conference

## dcb\_remfromconf()

**Name:** int dcb\_remfromconf(devh, confid, cdt)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
MS\_CDT \*cdt • pointer to conference descriptor element

**Returns:** 0 if success  
-1 if failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_remfromconf()** function removes a conferee from a conference. The conference identifier is the value previously returned by the **dcb\_estconf()** function. In this case, the channel attributes of the **MS\_CDT** structure are ignored.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	specifies the conference from which the conferee will be removed
<b>cdt</b>	points to an <b>MS_CDT</b> data structure that specifies the conferee (the attributes of the conferee are ignored)

- Notes:** 1. Call the appropriate **xx\_unlisten()** function before removing the TDM bus time slot member.  
2. Calling this function frees one conference resource.

### ■ Cautions

- An error will be returned if this function is used to attempt removal of the last remaining conferee from a conference. The **dcb\_delconf()** function must be used to end a conference.
- This function also fails when:
  - The device handle passed is invalid.
  - The conference identifier is invalid.
  - The conferee to be removed is not part of the specified conference.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>

## dcb\_setbrdparm( )

**Name:** int dcb\_setbrdparm(devh, param, valuep)

**Inputs:** int devh • valid board device handle  
unsigned char param • device parameter defined name  
void \* valuep • pointer to the parameter value

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Configuration

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_setbrdparm( )** function sets conference board device parameters.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the board device was opened using <b>dcb_open( )</b>
<b>param</b>	indicates the parameter whose value is to be set
<b>valuep</b>	the address of the integer or <b>MS_VOL</b> structure containing the values to be assigned to the parameter

The valid values for **param** and **valuep** are shown below:

**Note:** For **MSG\_ACTID**, **MSG\_ACTTALKERNOTIFYINTERVAL**, and **MSG\_TONECLAMP**, **valuep** points to an integer value. For **MSG\_VOLDIG**, **valuep** points to an **MS\_VOL** data structure.

#### **MSG\_ACTID** (Active Talker Identification)

Enables or disables Active Talker Identification (or Notification). Possible values are **ACTID\_ON** or **ACTID\_OFF**. **ACTID\_ON** is the default. This parameter does not enable or disable the active talker *feature*, which is always enabled. It only disables the *notification* to the application program. The active talker *feature* sums the 3 most active talkers in a conference, so that the conversation doesn't get drowned out when too many people talk at once. Active talker *notification* provides data on active talkers through the **dcb\_gettalkers( )** and **dcb\_GetAtiBitsEx( )** functions, which can be used by an application program to identify active talkers; for example, to provide a visual display highlighting the active talkers in a

conference. Active talkers are determined by their loudness; i.e., the strength of their “non-silence” energy.

**Note:** In some cases, it is desirable to inactivate the active talker feature, such as for a background music application program. Although you cannot directly disable the active talker *feature*, you can set the noise level threshold by which signals are recognized as either speech or noise. For more information, see the background music feature in the *Dialogic® Audio Conferencing API Programming Guide*.

#### MSG\_ACTTALKERNOTIFYINTERVAL (Active Talker Notification Interval)

Changes the interval specifying how frequently the Active Talker status is updated. The value is specified in 10 ms units. The default value is 100 (in 10 ms units), which results in a 1-second interval, and the maximum value is 1000, which results in a 10-second interval.

**Note:** If a low value is used, it can affect system performance due to the more frequent updating of the status (which results in a high quantity of internal notification messages). If a high value is used, it will result in less frequent updating of status, but the non-silence energy of a conferee may not be reported if it occurs between notification updates. For example, if the notification interval is set to 2 seconds and a conferee only says “yes” or “no” quickly in between notifications, that vocalization by the conferee will not be reported.

#### MSG\_VOLDIG (Volume Control Digits)

Defines the volume control status and volume up/down/reset digits as defined in the MS\_VOL data structure.

#### MSG\_TONECLAMP (Tone Clamp Activation)

Enables tone clamping for all parties to reduce the amount of DTMF tones heard in a conference. Tone clamping applies to the transmitted audio going into the conference and does not affect DTMF function. It is meaningful only in the full duplex or the transmit-only mode. Possible values are TONECLAMP\_ON or TONECLAMP\_OFF. TONECLAMP\_OFF is the default. (To enable on a per-party basis, set the MSPA\_PARTY\_TONECLAMP attribute in the MS\_CDT structure for the party.) Even with tone clamping, DTMF tones may be heard by conferees if the application encourages the user to repeatedly press DTMF tones; for example, press 9 to raise volume.

### ■ Cautions

- All parameter values must be integers or MS\_VOL data structures, but since this routine expects a void pointer to **valuep**, the address must be cast as a void\*.
- This function fails when:
  - The device handle is invalid
  - The parameter specified is invalid

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in `dtilib.h`, `msilib.h` or `dcblib.h`.

## **dcb\_setbrdparm()** — set conference board device parameters

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/

## ***dcb\_setcde()*** — *change the attributes of a conferee*

### **dcb\_setcde()**

**Name:** int dcb\_setcde(devh, confid, cdt)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier  
MS\_CDT \*cdt • pointer to conference descriptor element

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

#### ■ **Description**

The **dcb\_setcde()** function changes the attributes of a conferee in an existing conference.

<b>Parameter</b>	<b>Description</b>
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	specifies the conference identifier number
<b>cdt</b>	points to an <b>MS_CDT</b> data structure that defines the updated attributes of the conferee

#### ■ **Cautions**

- The **dcb\_setcde()** function cannot be used to enable or disable echo cancellation. Once a party belongs to a conference, you cannot enable or disable echo cancellation for that party. If attempted, it has no effect. To enable echo cancellation, use **dcb\_estconf()** or **dcb\_addtoconf()**
- This function fails when:
  - The device handle specified is invalid.
  - The conference identifier is invalid.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function `ATDV_LASTERR()` or `ATDV_ERRMSGP()` to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcplib.h*.

## ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcplib.h"

#define NUM_PARTIES 2

main()
{
    int dspdevh; /* DSP device handle */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    int confid; /* Conference identifier */
    int tsdevh1, tsdevh2; /* DTI time slot device handle */
    long scts; /* TDM bus transmit time slot */
    SC_TSINFO tsinfo; /* Time slot information structure */

    /* Open conference board 1, DSP 3 device */
    if ((dspdevh = dcb_open("dcbB1D3",0)) == -1) {
        printf("Cannot open dcbB1D3: system error/n");
        exit(1);
    }

    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf("Cannot open dtiB1T1: system error/n");
        exit(1);
    }

    /* Prepare time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    /* get transmit time slot of DTI tsdevh1 */
    if (dt_getxmitslot(tsdevh1, &tsinfo) == -1){
        printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
        exit(1);
    }

    /* Set up CDT structure */
    cdt[0].chan_num = (int)scts; /* TDM bus time slot returned */
    cdt[0].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
    cdt[0].chan_attr = MSPA_TARIFF; /* Conferee will receive period tariff tones */

    /* Open DTI board 1, time slot 2 */
    if ((tsdevh2 = dt_open("dtiB1T2",0)) == -1) {
        printf("Cannot open dtiB1T2: system error/n");

if (dt_listen(tsdevh2, &tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Now change the attribute of the last added conferee */
/* NOTE : scts still contains the transmit time slot of tsdevh2 */
cdt[0].chan_num = (int)scts;
cdt[0].chan_sel = MSPN_TS;
cdt[0].chan_attr = MSPA_TARIFF;

if((dcb_setcde(dspdevh, confid, &cdt[0])) == -1) {
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Perform 'unlistens' on the listening DTI time slots */
if (dt_unlisten(tsdevh1) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

if (dt_unlisten(tsdevh2) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Delete the conference */
if(dcb_delconf(dspdevh, confid) == -1) {
    printf("Cannot delete conference %d. Error Message = %s", confid,
        ATDV_ERRMSGP(dspdevh));
    exit(1);
}
```

## ***change the attributes of a conferee — dcb\_setcde()***

```
/* Close all open devices */
if (dt_close(tsdevh1) == -1){
    printf("Error closing tsdevh1\n");
    exit(1);
}

if (dt_close(tsdevh2) == -1){
    printf("Error closing tsdevh2\n");
    exit(1);
}

if (dcb_close(dspdevh) == -1){
    printf("Cannot close dcbB1D3: system error/n");
    exit(1);
}
}
```

## dcb\_setdigitmsk()

**Name:** int dcb\_setdigitmsk(devh, confid, bitmask, action)

**Inputs:**

int devh	• valid DSP device handle
int confid	• conference identifier
unsigned short bitmask	• event bitmask
int action	• change type

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Configuration

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_setdigitmsk()** function enables specific digit detection for a conference. The current bitmask is examined by a call to **dcb\_getdigitmsk()**.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open()</b>
<b>confid</b>	specifies the conference identifier number
<b>bitmask</b>	indicates the DTMF digit detection bitmask
<b>action</b>	specifies how the digit mask is changed. Possible values are: <ul style="list-style-type: none"><li>• CBA_ADDMSK – enables messages from the conference specified in <b>bitmask</b>, in addition to previously set events.</li><li>• CBA_SETMSK – enables notification of events specified in <b>bitmask</b> and disables notification of previously set events.</li><li>• CBA_SUBMSK – disables messages from the conference specified in <b>bitmask</b>.</li></ul>

**Note:** If MSG\_VOLDIG is enabled to give transparent volume control to the conferees, the digits for volume increase, decrease, and reset will not cause digit events to be generated. As a result, the application will not know if the volume changes.

The **bitmask** determines the digits to be detected. Upon detection of a DTMF digit, a DCBEV\_DIGIT event is generated on a DSP device handle. The **sr\_getevtdatap()** function can be used to retrieve the **DCB\_DIGITS** data structure.

The possible values for **bitmask** are:

- CBMM\_ZERO  
Detect digit 0
- CBMM\_ONE  
Detect digit 1
- CBMM\_TWO  
Detect digit 2
- CBMM\_THREE  
Detect digit 3
- CBMM\_FOUR  
Detect digit 4
- CBMM\_FIVE  
Detect digit 5
- CBMM\_SIX  
Detect digit 6
- CBMM\_SEVEN  
Detect digit 7
- CBMM\_EIGHT  
Detect digit 8
- CBMM\_NINE  
Detect digit 9
- CBMM\_STAR  
Detect digit \*
- CBMM\_POUND  
Detect digit #(octothorpe)
- CBMM\_A  
Detect digit A
- CBMM\_B  
Detect digit B
- CBMM\_C  
Detect digit C
- CBMM\_D  
Detect digit D
- CBMM\_ALL  
Detect ALL digits

For example, to enable notification of the digits specified in the **bitmask** parameter and disable notification of previously set digits:

## ***dcb\_setdigitmsk()*** — enable specific digit detection

- specify the digits to enable in the **bitmask** field
- specify the CBA\_SETMSK in the **action** field

To enable an additional digit specified in **bitmask** without disabling the currently enabled digits:

- specify the digits in **bitmask**
- specify CBA\_ADDMSK in the **action** field

To disable digits in **bitmask** without disabling any other digits:

- specify the digits in **bitmask**
- specify CBA\_SUBMSK in the **action** field

To disable all currently enabled digits:

- specify 0 in **bitmask**
- specify CBA\_SETMSK in the **action** field

### ■ Cautions

This function fails when:

- The device handle specified is invalid.
- The action specified is invalid.
- Invalid conference identifier.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcplib.h*.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcplib.h"

#define NUM_PARTIES 2

main()
{
    int dspdevh;          /* DSP device handle */
    int confid;          /* Conference Identifier */
    unsigned int bitmask; /* Digit bitmask */
    int tsdevh1, tsdevh2; /* DTI time slot device handles */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    long scts;          /* TDM bus transmit time slot */
}
```

## ***enable specific digit detection — dcb\_setdigitmsk()***

```
/* Open conference board 1, DSP 2 device */

**dcb\_SetPartyParm( )** — set the parameters for a conferee

## dcb\_SetPartyParm( )

**Name:** int dcb\_SetPartyParm(hSrlDevice, nConferenceID, Partycdt, unPartyParm, Value, rfu)

**Inputs:**

int hSrlDevice	• valid DSP device handle
int nConferenceID	• conference identifier
MS_CDT *Partycdt	• pointer to conference descriptor table element
unsigned int unPartyParm	• the parameter whose value is to be altered
void *Value	• the address of the integer or structure containing the value(s) to be assigned
void *rfu	• void pointer reserved for future use

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcblib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_SetPartyParm( )** function sets the parameters for a conferee (conference party).

**Note:** This function is **not** supported on Dialogic® Host Media Processing (HMP) Software.

Parameter	Description
<b>hSrlDevice</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>nConferenceID</b>	specifies the conference identifier number
<b>Partycdt</b>	points to an <b>MS_CDT</b> data structure that defines the attributes of the conferee <b>Note:</b> The chan_attr field of the MS_CDT structure is not used and is ignored by the <b>dcb_SetPartyParm( )</b> function.
<b>unPartyParm</b>	specifies the parameter whose value is to be altered. See list of parameters following this table.
<b>Value</b>	points to the integer or structure containing the value to be assigned to <b>unPartyParm</b> . See list of valid values for a parameter following this table.
<b>rfu</b>	void pointer reserved for future use

## set the parameters for a conferee — *dcb\_SetPartyParm()*

The valid values for **unPartyParm** and **Value** are shown below:

### MSPA\_OUTPUTVOLABS

Specifies the absolute output volume level. Output volume refers to the volume that a conferee hears from a conference. Valid values are: -24 dB to +12 dB, in increments of +/- 1 dB.

### MSPA\_OUTPUTVOLRELCUR

Specifies the output volume level relative to the current volume level produced by the conference. Valid values are: -36 dB to +36 dB. The resulting volume should not exceed -24 dB to +12 dB.

## ■ Cautions

- This function is **not** supported on Dialogic® Host Media Processing (HMP) Software.
- This function fails when:
  - the device handle specified is invalid.
  - the conference identifier is invalid.

## ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR()** or **ATDV\_ERRMSGP()** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

## ■ Example

```
#include <stdio.h>
#include "srllib.h"

**dcb\_unmonconf( )** — remove a monitor from a conference

## dcb\_unmonconf( )

**Name:** int dcb\_unmonconf(devh, confid)

**Inputs:** int devh • valid DSP device handle  
int confid • conference identifier

**Returns:** 0 on success  
-1 on failure

**Includes:** srllib.h  
dtilib.h  
msilib.h  
dcbllib.h

**Category:** Conference Management

**Mode:** synchronous

**Dialogic®** DM3

**Platform:**

---

### ■ Description

The **dcb\_unmonconf( )** function removes a monitor from a conference.

Parameter	Description
<b>devh</b>	specifies the valid device handle obtained when the DSP device was opened using <b>dcb_open( )</b>
<b>confid</b>	specifies the conference identifier

- Notes:** 1. Calling this function frees one resource.
2. Call the appropriate **xx\_unlisten( )** function for each conferee listening to the monitored signal before **dcb\_unmonconf( )** is called.

### ■ Cautions

This function fails when:

- The device handle specified is invalid.
- It is called for a non-conference board.
- An invalid conference is specified.
- A monitor does not exist in the conference.

### ■ Errors

If this function returns -1 to indicate failure, obtain the reason for the error by calling the Standard Runtime Library standard attribute function **ATDV\_LASTERR( )** or **ATDV\_ERRMSGP( )** to retrieve either the error code or a pointer to the error description, respectively.

Refer to [Chapter 5, “Error Codes”](#) of this guide for a list of error codes. Error defines can be found in *dtilib.h*, *msilib.h* or *dcblib.h*.

### ■ Example

```
#include <windows.h> /*include in Windows applications only; exclude in Linux*/
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"

#define NUM_PARTIES    2

main()
{
    int dspdevh;          /* DSP device handle */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    int confid;          /* Conference identifier */
    int tsdevh1, tsdevh2, tsdevh3; /* DTI time slot device handles */
    long lts, scts;      /* listen/transmit time slots */
    SC_TSINFO tsinfo;    /* Time slot information structure */

    /* Open conference board 1, DSP 1 device */
    if ((dspdevh = dcb_open("dcbB1D1",0)) == -1) {
        printf("Cannot open dcbB1D1: system error/n");
        exit(1);
    }

    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1: system error/n");
        exit(1);
    }

    /* Prepare the time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    /* Get transmit time slot of DTI tsdevh1 */
    if (dt_getxmitslot(tsdevh1, &tsinfo) == -1){
        printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
        exit(1);
    }

    /* Set up CDT structure */
    cdt[0].chan_num = (int)scts; /* TDM bus time slot returned */
    cdt[0].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
    cdt[0].chan_attr = MSPA_NULL; /* Conferee has no special attributes */

    /* Open DTI board 1, time slot 2 */
    if ((tsdevh2 = dt_open("dtiB1T2",0)) == -1) {
        printf("Cannot open dtiB1T2: system error/n");
        exit(1);
    }

    /* Open board 1, time slot 3 */
    if ((tsdevh3 = dt_open("dtiB1T3",0)) == -1) {
        printf( "Cannot open dtiB1T3: system error/n");
        exit(1);
    }
}
```

## ***dcb\_unmonconf()*** — *remove a monitor from a conference*

```
/* get transmit time slot of DTI TS device 2 */
if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Set up CDT structure */
cdt[1].chan_num = (int)scts; /* TDM bus time slot returned */
cdt[1].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
cdt[1].chan_attr = MSPA_NULL; /* Conferee has no special attributes */

/* Establish a 2 party conference */
if (dcb_estconf(dspdevh, cdt, NUM_PARTIES, MSCA_ND, &confid) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Do a listen for the DTI tsdevh1 device */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarray = &cdt[0].chan_lts;

if (dt_listen(tsdevh1,&tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

/* Do a listen for the DTI tsdevh2 device */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarray = &cdt[1].chan_lts;

if (dt_listen(tsdevh2,&tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Now monitor the conference on TDM bus time slot lts */
if((dcb_monconf(dspdevh, confid, &lts)) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Prepare a time slot info structure */
tsinfo.sc_numts = 1;
tsinfo.sc_tsarray = &lts;

/* And let a DTI time slot, tsdevh3, monitor the conference */
if (dt_listen(tsdevh3,&tsinfo) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh4));
    exit(1);
}

/* Perform an 'unlisten' for the DTI time slot */
if (dt_unlisten(tsdevh3) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh4));
    exit(1);
}

/* Now remove the monitoring */
if((dcb_unmonconf(dspdevh,confid)) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
}
```

## remove a monitor from a conference — `dcb_unmonconf()`

```
/* Perform 'unlistens' for the remaining DTI time slots */
if (dt_unlisten(tsdevh1) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
    exit(1);
}
if (dt_unlisten(tsdevh2) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Delete the conference */
if(dcb_delconf(dspdevh, confid) == -1) {
    printf("Cannot delete conference %d : Error Message = %s", confid,
        ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* And close all open devices */
if (dt_close(tsdevh1) == -1){
    printf("Error closing tsdevh1\n");
    exit(1);
}
if (dt_close(tsdevh2) == -1){

This chapter provides information on events that may be generated by the *Dialogic*<sup>®</sup> Audio Conferencing Software.

An event indicates that a specific activity has occurred within a conference or conferences. For information on handling conference events, refer to the *Dialogic*<sup>®</sup> *Audio Conferencing API Programming Guide*. For details on event management and event handling, see the *Dialogic*<sup>®</sup> *Standard Runtime Library API Programming Guide* and *Dialogic*<sup>®</sup> *Standard Runtime Library API Library Reference*.

The following events may be generated by functions in the audio conferencing library:

#### DCBEV\_BRIDGEESTABLISHED

Returned by the **dcb\_CreateBridge()** function to indicate that a conference bridge has been established.

#### DCBEV\_BRIDGEREMOVED

Generated by the **dcb\_DeleteBridge()** to indicate that a conference bridge has been deleted.

#### DCBEV\_CTU

Generated when the conference descriptor table for a conferee has been updated.

#### DCBEV\_DELALLCONF

Returned by the **dcb\_DeleteAllConferences()** function to indicate that all active conferences have been successfully deleted.

#### DCBEV\_DIGIT

Returned when a digit detection event occurs.

**Note:** Any conferee participating in a conference in receive-only mode (MSPA\_MODERECVONLY attribute) cannot generate DTMF digits within the conference, therefore any digits dialed by a conferee in receive-only mode will not generate DCBEV\_DIGIT events.

#### DCBEV\_ERREVT

Indicates an error has occurred within the application.

## ***Events***

This chapter contains information about the data structures used by the *Dialogic*<sup>®</sup> Audio Conferencing API. The following data structures are used:

- [DCB\\_CT](#) ..... 112
- [DCB\\_DIGITS](#) ..... 113
- [MS\\_CDT](#) ..... 114
- [MS\\_VOL](#) ..... 117
- [TS\\_BRIDGECDT](#) ..... 118

## DCB\_CT

```
typedef struct dcb_ct
{
    int confid;
    int chan_num;
    int chan_sel;
} DCB_CT;
```

### ■ Description

The DCB\_CT data structure contains information about active talkers within a conference. Refer to the [dcb\\_gettalkers\(\)](#), [dcb\\_GetAtiBitsEx\(\)](#), and [dcb\\_setbrdparm\(\)](#) functions and to the *Dialogic® Audio Conferencing API Programming Guide* for more information about the active talker feature.

### ■ Field Descriptions

The fields of the DCB\_CT data structure are described as follows:

confid

conference identifier number of the conference being monitored for active talkers

chan\_num

denotes the TDM bus transmit time slot number occupied by the active talker

chan\_sel

defines the specific meaning of the chan\_num field. For the current System Software release, chan\_sel must be set to the following value:

- MSPN\_TS: – TDM bus time slot

## DCB\_DIGITS

```
typedef struct dcb_digits
{
    unsigned char  dsp;
    int           confid;
    int           chan_num;
    int           chan_sel;
    int           chan_attr;
    unsigned char  digits[MAX_DCBDIGS+1];
    unsigned char  dig_type;
} DCB_DIGITS;
```

### ■ Description

The DCB\_DIGITS data structure defines the format of DCBEV\_DIGIT events that are generated when a conferee presses a pre-determined DTMF digit. The pre-determined DTMF digits are defined for a conference via the **bitmask** parameter in the [dcb\\_setdigitmsk\(\)](#) function.

### ■ Field Descriptions

The fields of the DCB\_DIGITS data structure are described as follows:

**dsp**

indicates the DSP of the conference that generated the event

**confid**

specifies the conference identifier of the conference that generated the event

**chan\_num**

denotes the TDM bus transmit time slot number of the conferee that generated the event

**chan\_sel**

defines the specific meaning of the chan\_num field. For the current System Software release, chan\_sel must be set to the following value:

- MSPN\_TS: – TDM bus time slot

**chan\_attr**

describes the properties of the conferee that generated the event. Refer to the chan\_attr field of the [MS\\_CDT](#) data structure for a list of valid conferee properties.

**digits[MAX\_DCBDIG+1]**

denotes an ASCII string of detected DTMF digits

**dig\_type**

indicates the type of digit detected (DTMF)

## MS\_CDT

```
typedef struct ms_cdt
{
    int chan_num;    /*time slot number*/
    int chan_sel;    /*meaning of time slot number */
    int chan_attr;   /*attribute description*/
} MS_CDT;
```

### ■ Description

The MS\_CDT data structure specifies a conferee and its attributes. The chan\_attr field is a bitmask that contains the conferee's properties within the conference.

This data structure is used to define or retrieve a conferee and its attributes. The following functions specify this structure to *define* attributes: addtoconf, estconf, and setcde. The following functions specify this structure to *retrieve* attributes: getcde, getcnflist, and gettalkers. Also, the remfromconf function uses the data structure to specify a conferee to remove from the conference (in this case, the attributes are *ignored*).

### ■ Field Descriptions

The fields of the MS\_CDT data structure are described as follows:

chan\_num

denotes the TDM bus transmit time slot number of the device to be included in the conference

chan\_sel

defines the specific meaning of the chan\_num field. For the current System Software release, chan\_sel must be set to the following value:

- MSPN\_TS: – TDM bus time slot

chan\_attr

a bitmask that specifies the conferee's properties within the conference. The following attributes are described as setting or defining the attribute; however, for functions that retrieve attributes, they would indicate whether the attribute is set. Valid settings are as follows:

- MSPA\_BROADCASTEN – Enables the broadcast feature for conferee. This parameter sets one party to talk while all others are muted.
- MSPA\_COACH – Establishes conferee as a coach. Coach is heard by the pupil only. (When using the coach/pupil feature on analog lines, make sure to use echo cancellation so that other parties do not hear an echo of the coach.)
- MSPA\_ECHOCLEN – Enables echo cancellation for conferee. The echo cancellation feature supplies 128 tap (16 msec) echo cancellation with the audio conferencing interface. The default setting for echo cancellation is disabled. Echo cancellation can only be enabled when establishing the conference with **dcb\_estconf()** or when adding a party to the conference with **dcb\_addtoconf()**. It cannot be enabled using **dcb\_setcde()**, and if attempted, has no effect. Once a party belongs to a conference, you cannot enable or disable echo cancellation for that party. If a conferee/party resides on an analog line, make sure to use echo cancellation so that the other parties do not hear an echo.
- MSPA\_MODEFULLDUPLEX – Establishes conferee in full duplex mode, in which conferee may transmit and receive in the conference. Conferee hears everyone except the

coach. This property is equivalent to MSPA\_NULL and MSPA\_MODENULL. See also “Notes” following the attributes.

- MSPA\_MODENULL – Establishes conferee as a NULL party. Conferee has no dedicated transmit or receive slots. A NULL party is often used as a placeholder for establishing a conference for a fixed number of parties. This is equivalent to MSPA\_NULL and MSPA\_FULLDUPLX. See also “Notes” following the attributes.
- MSPA\_MODERECVONLY – Establishes conferee in receive-only mode, in which conferee may only receive in the conference. Any conferee in receive-only mode cannot generate DTMF digits within the conference, therefore any digits dialed by a conferee in receive-only mode will not generate DCBEV\_DIGIT events. See also “Notes” following the attributes.
- MSPA\_MODEXMITONLY – Establishes conferee in transmit-only mode, in which conferee may only transmit in the conference. See also “Notes” following the attributes.
- MSPA\_NOAGC – Disables Automatic Gain Control for a conferee.
- MSPA\_NULL – No special attributes for conferee. This is equivalent to MSPA\_MODENULL and MSPA\_FULLDUPLX.
- MSPA\_PARTY\_TONECLAMP – Enables DTMF tone clamping for the conferee. (To enable for all conferees, enable the MSG\_TONECLAMP parameter with the [dcb\\_setbrdparm\(\)](#) function.) Even with tone clamping, DTMF tones may be heard by conferees if the application encourages the user to repeatedly press DTMF tones; for example, press 9 to raise volume.
- MSPA\_PUPIL – Establishes conferee as a pupil. Pupil hears everyone including the coach. (When using the coach/pupil feature on analog lines, make sure to use echo cancellation so that other parties do not hear an echo of the coach.)
- MSPA\_TARIFF – Enables periodic tone transmission to conferee so that conferee hears periodic tone for duration of call.

- Notes:*
1. The MSPA\_MODENULL, MSPA\_MODERECVONLY, MSPA\_MODEXMITONLY and MSPA\_MODEFULLDUPLX attributes are mutually exclusive. Furthermore, the attributes cannot be ORed together with any other conference attributes when calling the [dcb\\_setcde\(\)](#) function. For example, to set a conferee’s attributes as full-duplex with a tariff tone, you must call the [dcb\\_setcde\(\)](#) function twice: once to set the MSPA\_MODEFULLDUPLX attribute and once to set the MSPA\_TARIFF attribute.
  2. The [dcb\\_setcde\(\)](#) function cannot be used to enable or disable echo cancellation. Once a party belongs to a conference, you cannot enable or disable echo cancellation for that party. If attempted, it has no effect. To enable echo cancellation, use [dcb\\_estconf\(\)](#) or [dcb\\_addtoconf\(\)](#).
  3. Only one coach and one pupil are allowed in a conference at any time. Specifying more than one of either will cause unexpected results.
  4. If a conferee/party resides on an analog line, make sure to use echo cancellation so that the other parties do not hear an echo. This is especially important when using the coach/pupil feature on analog lines.
  5. The default MSPA\_NULL must be used if channel attributes are not specified.
  6. Invalid attribute combinations may lead to unexpected results.
  7. For a background music application, such as a dating chat line where two callers talk while music plays in the background, when the music resource is added to the conference, it should be added in transmit-only mode using MSPA\_MODEXMITONLY. (A media load specifically for background music is typically used with these types of applications to achieve the right mix of

***MS\_CDT — conference descriptor element***

resources on the board and to maximize density. For Dialogic<sup>®</sup> Host Media Processing (HMP) Software, the desired ratio of resources is determined by the license.)

## MS\_VOL

```
typedef struct ms_vol
{
    unsigned char vol_control;
    unsigned char vol_up;
    unsigned char vol_reset;
    unsigned char vol_down;
} MS_VOL;
```

### ■ Description

The MS\_VOL data structure defines whether or not volume control is active for a conference and which DTMF digits increase, decrease and reset the volume. This data structure is used by the [dcb\\_setbrdparm\(\)](#) and [dcb\\_getbrdparm\(\)](#) functions to control volume on a board basis.

**Note:** To adjust output (or speaker) volume on an individual conferee basis, see the [dcb\\_SetPartyParm\(\)](#) and [dcb\\_GetPartyParm\(\)](#) functions.

### ■ Field Descriptions

The fields of the MS\_VOL data structure are described as follows:

**vol\_control**

determines whether or not volume control is activated. Possible values are as follows:

- ON
- OFF

**vol\_up**

indicates the DTMF digit used for increasing the volume level.

**vol\_reset**

indicates the DTMF digit used to reset the volume to its default level.

**vol\_down**

indicates the DTMF digit used for decreasing the volume level.

## TS\_BRIDGECDT

```
typedef struct bridgecdt
{
    MS_CDT cdtA;
    MS_CDT cdtB;
    unsigned int nBridgeID;
} TS_BRIDGECDT;
```

### ■ Description

The TS\_BRIDGECDT data structure defines the two conferences that are included in a conference bridge and provides a unique identifier for the conference bridge. This data structure allows conferencing applications to maintain the timeslots associated with a conference bridge in one location.

The data structure is composed of three elements, two [MS\\_CDT](#) data structures that are used to transfer the conference bridge party timeslots to the application and an unsigned integer that defines a unique conference bridge identifier for asynchronous mode events.

### ■ Field Descriptions

The fields of the TS\_BRIDGECDT data structure are described as follows:

cdtA

conference descriptor element for the master conference

cdtB

conference descriptor element for the conference that is bridged to the master conference

nBridgeID

denotes the bridge identification number that uniquely identifies a conference bridge. This number is returned to the application by the [dcb\\_CreateBridge\(\)](#) function.

This chapter lists the error codes that may be returned by the Dialogic<sup>®</sup> Audio Conferencing API functions.

The values of error codes that may be returned to the application by the conferencing devices are a subset of errors used by the Dialogic<sup>®</sup> Digital Network Interface products and the Dialogic<sup>®</sup> Modular Station Interface products. Error codes preceded by EDT\_ are taken from the Digital Network Interface library (*dtilib.h*) and error codes preceded by E\_ are taken from the Modular Station Interface library (*msilib.h*).

The following error codes can be generated by the Dialogic<sup>®</sup> Audio Conferencing API library:

EDT\_ADDR

Incorrect address.

EDT\_BADBRDERR

Board is missing or defective.

EDT\_BADCMDERR

Invalid or undefined command to driver.

EDT\_BADCNT

Incorrect count of bytes requested.

EDT\_BADDEV

Bad device error.

EDT\_BADGLOB

Incorrect global parameter number.

EDT\_BADPORT

First byte appeared on reserved port.

EDT\_BADVAL

Invalid parameter value passed in value pointer.

EDT\_CHKSUM

Incorrect checksum.

EDT\_DATTO

Data reception timed out.

EDT\_DTTSTMOD

In test mode; cannot set board mode.

EDT\_FWERR

Firmware returned an error.

EDT\_HSIBRIDGEERR

**Dialogic<sup>®</sup> Host Media Processing (HMP) Software Only:** Error when creating a Host Streaming Interface bridge connection between Dialogic<sup>®</sup> HMP Software and a board.

## **Error Codes**

EDT_INVBD	Invalid board.
EDT_INVMSG	Invalid message.
EDT_INVTS	Invalid time slot.
EDT_MBFMT	Wrong number of bytes for multiple byte request.
EDT_MBIMM	Received an immediate termination.
EDT_MBINV	First byte appeared on data port.
EDT_MBOVR	Message was too long.
EDT_MBPORT	Received multiple byte data on port other than 0 or 1.
EDT_MBTERM	Terminating byte other than FEH or FFH.
EDT_MBUND	Under the number of bytes for a multibyte request.
EDT_MSGCNT	Count received did not match actual count.
EDT_NOCLK	No clock source present.
EDT_NOIDLEERR	Time slot is not in idle/closed state.
EDT_NOMEMERR	Cannot map or allocate memory in driver.
EDT_NOTDNLD	Not downloaded.
EDT_PARAMERR	Invalid parameter. This error occurs if you execute an audio conferencing library function on a board that does not support that particular function.
EDT_RANGEERR	Bad/overlapping physical memory range.
EDT_SH_BADINDX	Invalid Switching Handler index number.
EDT_SH_BADEXITS	Returned time slot is unsupported in current clock rate.
EDT_SH_BADLCLTS	Invalid local time slot number.

EDT\_SH\_BADMODE  
Invalid bus mode.

EDT\_SH\_BADTYPE  
Invalid local time slot type.

EDT\_SH\_LCLDSCNCT  
Local time slot is already disconnected from TDM bus.

EDT\_SH\_LCLTSCNCT  
Local time slot is already connected to the TDM bus.

EDT\_SH\_LIBBSY  
Switching Handler Library is busy.

EDT\_SH\_LIBNOTINIT  
Switching Handler Library has not been initialized.

EDT\_SH\_MISSING  
Switching Handler is not present.

EDT\_SH\_NOCLK  
Switching Handler Clock fallback failed.

EDT\_SIGINS  
Insertion signaling not enabled.

EDT\_SIGTO  
Transmit/receive did not update in time.

EDT\_SIZEERR  
Message too big or too small.

EDT\_SKIPRPLYERR  
A required reply was skipped.

EDT\_STARTED  
Cannot start when already started.

EDT\_SYSTEM  
Operating system error.

EDT\_TMOERR  
Timed out waiting for reply from firmware.

EDT\_TSASN  
Time slot already assigned.

E\_MSIPTY  
Cannot remove party from one party conference.

E\_MSBADCHPARAM  
Invalid channel parameter number.

E\_MSBADVAL  
Invalid parameter value.

E\_MSCHASNCNF  
Channel is assigned to conference.

## **Error Codes**

<code>E_MSCNFFUL</code>	Conference system is full.
<code>E_MSCNFLMT</code>	Exceeds conference limit.
<code>E_MSGLOBREAD</code>	Cannot read parameter globally.
<code>E_MSINVCB</code>	Invalid control block ID.
<code>E_MSINVCATTR</code>	Invalid conference attribute.
<code>E_MSINVCNF</code>	Invalid conference number.
<code>E_MSINVDSP</code>	Invalid DSP specified.
<code>E_MSINVMT</code>	Invalid multitasking function.
<code>E_MSINVPATTR</code>	Invalid party attribute.
<code>E_MSINVPTYNUM</code>	Invalid party number.
<code>E_MSINVPTYCNT</code>	Invalid number of parties specified.
<code>E_MSINVPTYTYPE</code>	Invalid conference member type.
<code>E_MSINVVAL</code>	Bad global parameter value.
<code>E_MSINVTS</code>	Invalid time slot number specified.
<code>E_MSMONEXT</code>	Monitor already exists for this conference.
<code>E_MSNOCNF</code>	No conferencing available on device.
<code>E_MSNO DSPTS</code>	All time slots going to the DSP are busy.
<code>E_MSNOFEMCH</code>	No DCB/SC daughterboard to support this channel.
<code>E_MSNO MON</code>	No monitor exists for this conference.
<code>E_MSNO NCNFCH</code>	Channel is not assigned to specified conference.

E\_MSNOTS  
No time slot assigned to channel.

E\_MSPTYASN  
Party already assigned.

E\_MSSYSTEM  
Operating system error.

E\_MSTSASNCNF  
Time slot already assigned to a conference.
